

# 200 MHz VHF Dual Channel, Dual Time Base Oscilloscope PM3285A - PM3286A

## Service Manual

4822 872 05317  
870619

---

---

**WARNING!** These servicing instructions are of use by qualified personal only.  
To avoid electric shock, do not perform any servicing other than that  
contained in the operating instructions unless you are qualified do so.

**Industrial &  
Electro-acoustic Systems**

**PHILIPS**

IMPORTANT

In correspondence concerning this instrument, please quote the type number and serial number as given on the type plate.

NOTE: The design of this instrument is subject to continuous development and improvement.  
Consequently, this instrument may incorporate minor changes in detail from the information contained in this manual.

## **SAFETY INSTRUCTIONS**

CONTENTS

1. SAFETY INSTRUCTIONS	
1.1 Introduction	1-1
1.2 Safety precautions	1-1
1.3 Caution and warning statements	1-1
1.4 Symbols	1-1
1.5 Impaired safety protection	1-2
1.6 General clauses	1-2

## 1. SAFETY INSTRUCTIONS

Read these pages carefully before installation and use of the instrument.

### 1.1. INTRODUCTION

The following clauses contain information, cautions and warnings which must be followed to ensure safe operation and to retain the instrument in a safe condition. Adjustment, maintenance and repair of the instrument shall be carried out only by qualified personnel.

### 1.2. SAFETY PRECAUTIONS

For the correct and safe use of this instrument it is essential that both operating and servicing personnel follow generally-accepted safety procedures in addition to the safety precautions specified in this manual.

Specific warning and caution statements, where they apply, will be found throughout the manual.

Where necessary, the warning and caution statements and/or symbols are marked on the apparatus.

### 1.3. CAUTION AND WARNING STATEMENTS

CAUTION: is used to indicate correct operating or maintenance procedures in order to prevent damage to or destruction of the equipment or other property.

WARNING: calls attention to a potential danger that requires correct procedures or practices in order to prevent in order to prevent personal injury.

### 1.4. SYMBOLS

High voltage  $\geq 1000$  V (red)

Live part (black/yellow)

Read the operating instructions.

Protective earth (grounding) terminal (black)

## 1.5. IMPAIRED SAFETY-PROTECTION

Whenever it is likely that safety-protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation. The matter should then be referred to qualified technicians.

Safety protection is likely to be impaired if, for example, the instrument fails to perform the intended measurements or shows visible damage.

## 1.6. GENERAL CLAUSES

1.6.1. WARNING: The opening of covers or removal of parts, except those to which access can be gained by hand, is likely to expose live parts and accessible terminals which can be dangerous to live.

1.6.2. The instrument shall be disconnected from all voltage sources before it is opened.

1.6.3. Bear in mind that capacitors inside the instrument can hold their charge even if the instrument has been separated from all voltage sources.

1.6.4. WARNING: Any interruption of the protective earth conductor inside or outside the instrument, or disconnection of the protective earth terminal, is likely to make the instrument dangerous. Intentional interruption is prohibited.

1.6.5. Components which are important for the safety of the instrument may only be renewed by components obtained through your local Philips organisation. (See also section 27).

1.6.6. After repair and maintenance in the primary circuit, safety inspection and tests, as mentioned in Section 27 have to be performed.

## GENERAL INFORMATION

2.2. Characteristics	2-2

FIGURES

2.1. 200 MHz V.H.F. oscilloscope	2-1
2.2. Input resistance R par. and capacitance C par. versus frequency	2-27
2.3. Maximum input voltage (peak to peak) derating versus frequency	2-27

## 2. GENERAL INFORMATION

### 2.1. INTRODUCTION TO THE V.H.F. OSCILLOSCOPE FAMILY.

This compact V.H.F. oscilloscope features an extensive bandwidth of 200 MHz and good ergonomic design for its numerous measurement capabilities. A unique feature is the AUTO SET pushbutton facility, which automatically sets various controls of the instrument to suit the input signal value. In this way, optimum ease of operation is obtained as the input signal immediately presents a correct, stable display on the bright c.r.t. screen.

The microprocessor-controlled front panel gives a wide choice of display possibilities.

MAT 1583

Fig. 2.1. 200 MHz V.H.F. oscilloscope.

The oscilloscope is provided with integrated circuits (including thin-film circuits), which guarantee highly-stable operation.

Furthermore, connection to the local mains is simplified by a tapless switched-mode power supply that covers most voltage ranges in use: 90 V . . . 264 V a.c.

All these features make this oscilloscope suitable for a wide range of measuring applications.

## CHARACTERISTICS

## A. Performance Characteristics

- Properties expressed in numerical values with stated tolerance are guaranteed by PHILIPS. Specified non-tolerance numerical values indicate those that could be nominally expected from the mean of a range of identical instruments.
- This specification is valid after the instrument has warmed up for 30 minutes (reference temperature 23°C).
- For definitions of terms, reference is made to IEC Publication 351-1.

## B. Safety Characteristics

This apparatus has been designed and tested in accordance with:  
 Safety Class I requirements of IEC Publication 348  
 Safety Requirements for Electronic Measuring  
 Apparatus, UL 1244 and CSA 556B.

The instrument has been supplied in a safe condition

## C. Initial Characteristics

## Height

Without Feet and

Accessory Pouch      170 mm (6,7 in)      Add 10 mm (0,4 in) for feet

Feet and accessory  
 pouch included

240 mm (9,4 in)

## Width

340 mm (13,4 in)      Add 46 mm (1,8 in) for handle

## Depth

Handle Excluded

473 mm (18,6 in)

Add 35 mm (1,4 in) for  
 protective front cover.

With Extended  
 handle

575 mm (22,6 in)

## Mass

13,6 kg (30 lb)

## - Operating positions:

a) Horizontally on bottom feet

b) Vertically on rear feet

c) On the carrying handle in three sloping positions= 12°, 20° and 25°

CHARACTERISTIC	SPECIFICATION	ADDITIONAL INFORMATION
2.2.1. DISPLAY		
Cathode Ray Tube		140mm Rectangular single beam tube with helical vertical deflection system.
Measuring Area (h. x w.)	80mm x 100mm	8 divisions x 10 divisions
Screen type:		
(basic version)	GH (P31)	
(optional)	GM (P7)	
	BE (P11)	
Total Acceleration Voltage:	16,5kV	
Max. Writing Speed		Measured in central 5 div x 5 div of screen; in absence of contrast filter.
(photographic)	typical 2cm/ns	Single Shot; Phosphor: GH; no prefogging; Lens aperture F:1,2; object to image ratio 1:0,5; Film: Polaroid type 612 (20 000 ASA).
Graticule	internal, fixed	
- Illumination	continuously variable	

2

- Engravings:		
division lines	At 1cm	Horizontal and vertical.
tick marks	At 2mm	On vert. and hor. central axes and on hor. lines at 2cm and 6cm from top.
dots	At 2mm	On dotted lines at 1,5cm and 6,5cm from top.
percentages	100, 90, 10, 0%	To facilitate rise and fall time measurements.

## 2.2.2. VERTICAL DEFLECTION

## OR Y-AXIS

Deflection Sources	Ch.A; Ch.B; Ch.A and Ch.B added	Both channels can be inverted, (allowing for A-B and B-A in added position).
	Trigger View (MTB)	
Deflection Modes:	1 Channel only; Alternate; Chopped	Any combination of sources.
- Display Time	350ns	Each source (in chopped mode).
- Display Blanking	150ns	After each display time (in chopped mode).
Visual Signal Delay	20ns (typical)	At Maximum intensity and well focused display.

## Delay Difference

between Ch.A  
or B and ext.  
Trigg. View typ 2ns

Trigger View delayed with resp.  
to Ch. A or B.

Channel Isolation:  
of Deselected Channel 100:1

At 50MHz; input to deselected  
channel equivalent to  
8 divisions or less.

between Selected  
Channels 50:1

At 200MHz; channels with equal  
V/div settings; input to  
either channel equivalent to  
8 divisions or less

Y-Signal Output:

Available at BNC on rear of  
instrument.  
Y Signal Output is not affected  
by BW limiter.

- Source =DTB Trigger  
Source

- Coupling = DTB Trigger  
Coupling

Ch.A or Ch.B coupling  
eventually cascaded with DTB  
trigger coupling

- Voltage into 1M.Ohm 20mV/div  
+ or - 10%  
into 50 Ohm 10mV/DIV  
+ or -10%

Max. output + or - 80mV (160mV  
peak to peak).  
Max. output + or - 40mV (80mV  
peak to peak).

- Freq. response d.c...200MHz  
(-3dB)

Terminated with 50 Ohm.  
For influence of trigger  
coupling see chapter 2.2.9.

## 2.2.3. CHANNELS A AND B

Input connector BNC with Probe  
Read Out Ring

Probe Read Out causes  
instrument to change V/div  
Indication, Input Impedance  
and Attenuator Setting  
according to probe (when fitted  
with a Probe Indicator)

Input impedance (in High Z position):

For Frequency >1MHz see Fig.2.2

R parallel 1M.0hm +or- 1%

In DC position of Input Coupling. In AC pos. of Input Coupling: 18 nF in Series with R. par & C. par; in 0 position of input coupling: R par.= infinite

C parallel 9pF

Max. input Cap. Difference 1,5pF

Difference between Channel A, Channel B, EXT MTB Trigger and EXT DTB Trigger Inputs.

Input Impedance (in 50 Ohm position):R parallel 50 Ohm + or - 1%

In DC, AC and 0 position of input coupling.

VSWR (typical) 1,2:1

At 200MHz in AC and DC pos. of input coupling

Input Coupling d.c.; a.c.; 0

In 0 position: channel disconnected from input BNC and connected to ground.

Max. Input Voltage :

Apparatus should be properly grounded through the protective-ground conductor of the power cord

- In High Z position (d.c. + a.c. pk.) 300V

Up to 1MHz; for >1MHz see Fig. 2.3.

- In 50 Ohm position (d.c.) 5V  
(a.c. r.m.s.) 5V  
(a.c. peak) 50V

Max 50mJ during any 100ms interval.

Deflection coefficient

- Steps 1mV...5V/div

In a 1-2-5 sequence of 12 steps;

- Error limit (Ambient: 5...40°C) +or- 2%

Add 1 % for Ambient: 0...50°C  
(When Channel is used for X deflection: see 2.2.5, for Trigger View: see 2.2.4.

- Vernier Ratio 1:2,5

Uncalibr.; continuously variable between steps.

## Dynamic Range:

When used for Y defl. (for X defl. see 2.2.5.)

Compression at limits of dynamic range: 7%

- up to 100MHz in CAL position of vernier 24div but max. 100V
- Vernier in 1:2,5 position 20div but max. 100V
- up to 200MHz (-3dB) 8 div

Centered around Hor.  
Centre line of screen

## LF Linearity:

Within boundaries of dynamic range.

Measured at 50kHz.

## Max. Compression or Expansion

0,1 div on  
2 div

2 div center screen signal shifted within boundaries of graticule.

## Shift Range

+ or - 8 div

From screen center; (for X defl. see 2.2.5.)

## Frequency Response (in 50 Ohm position):

When used for Y defl. (for X defl. see 2.2.5.)

Z source: 50 Ohm.

- Lower Transition Point of BW d.c. 10Hz or less (-3dB)
- Upper Transition Point of BW (Amb.: 15...35°C) 200MHz (-3dB)
- (Amb.: 0...50°C) 175MHz (-3dB)

Input Coupling in DC position.  
Input Coupling in AC position.

1mV and 2mV/div positions excluded (see 2.2.3.)

## Freq. Resp. (in Hi.Z pos. through probe):

When used for Y defl. (for X defl. see 2.2.5.)

Z source: 25 Ohm. (Probe according to 2.2.19.)

- Lower transition Point of BW d.c. 1Hz or less (-3dB)
- Upper Transition Point of BW (Amb.: 15...35°C) 200MHz (-3dB)
- (Amb.: 0...50°C) 175MHz (-3dB)

Input Coupling in DC position.  
Input Coupling in AC position.

1mV and 2mV/div positions excluded (see 2.2.3.).

## Freq. Resp. (in 1mV and 2mV/div pos.):

When used for Y defl. (for X defl. see 2.2.5.).

- Upper Transition Point of BW (Ambient: 5...40°C) 60MHz (-3dB)

50MHz at ambient: 0...50°C

**2****Bandwidth Limiter:**

- Starting point of HF rejection 20Mhz (-3dB)

- Slope 6dB/octave

Pulse Response (in 50 Ohm position):

When used for Y deflection; Z source: 50 Ohm. Measured over central 6 div.

- Rise Time

1mV and 2mV/div excluded, (see 2.2.3.) (Calculated from Bandwidth x Rise Time = 0,35)

(Amb.: 15...35°C) 1,75ns or less  
(Amb.: 0...50°C) 2ns or less

- Pulse Aberrations:  
(ambient:5...40°C)

5% or less

Tested with a 1ns Rise Time pulse at 20mV/div.  
Add 2% for ambient:0...50°C

- Pulse response (in Hi.Z pos. through probe)

When used for Y defl: Z source 25 Ohm. Measured over central 6 divisions

- Rise Time

1mV and 2mV/div excluded, see 2.2.3. (Calculated from Bandwidth x Rise Time = 0,35).

(Amb.: 15...35°C) 1,75ns or less  
(Amb.: 0...50°C) 2ns or less

- Pulse Aberrations:

Tested with a 1ns Rise Time pulse

overshoot 6% or less

Rise Time (in 1mV and 2mV/div pos.) 5,4ns or less

When used for Y defl. Measured over central 6 divisions.

Max. Base Line  
Instability:  
Jump

- between any V/div  
positions 0,2 div or 1 mV Whichever is greater

Common Mode Rejection  
Ratio:

Both channels at same  
attenuator setting;  
vernier of V/div  
setting adjusted for best CMMR;  
measured with max. 8 div input  
at each channel, (+ or - 4div  
around zero).

- at 1MHz 100:1  
- at 50MHz 20:1

#### 2.2.4. TRIGGER VIEW

Signal Source = Trigger  
Source MTB

COMPOSITE = Channel A, unless  
only Channel B is displayed.

Deflection  
coefficient:

Ch.A or Ch.B see 2.2.3.  
EXT 100mV/div  
EXT:10 1V/div

Except error limit.

Error Limit + or - 5%

For all sources except LINE

Dynamic Range:

up to 100MHz 24div  
up to 200MHz 8div

Compression at limits of  
Dynamic Range: 7%

**2**

Line deflection                      6 div or more                      Trigger Source: LINE; 49Hz<Line Freq.<61Hz

Frequency response:                      Trigger coupling: DC, HF  
REJection: OFF, Bandwidth  
Limiter: OFF.

Trigger source:                      d.c...150MHz                      Channel A or B in 50 Ohm  
INT                      (-3dB)                      position. Z of Signal Source:  
50 Ohm.

Trigger source:EXT                      d.c...200MHz }  
(Ambient: 15...35°C)                      d.c...160MHz } Z of Signal Source: 25 Ohm  
(Ambient: 5...40°C)                      d.c...150MHz }

Pulse Response                      Trigg. Coupling: DC, HF  
REJection: OFF, Band Width  
Limiter: OFF  
Distortion due to peak to peak  
leveling may be visible, when  
in AUTO position of trigger  
selector and at trigger  
frequencies <100Hz.

Rise Time                      (Calculated from Bandwidth x  
Rise Time = 0,35).

Trigger source:                      2,33 ns                      Z of Signal Source: 50 Ohm  
INT

Trigger source: EXT                      Z of Signal Source: 25 Ohm

(Ambient: 5...40°C)                      2,19 ns  
(Ambient: 0...50°C)                      2,33 ns

Trigger Point                      center of                      Measured at 50kHz.  
screen

#### 2.2.5. HORIZONTAL DEFLECTION OR X-AXIS

Deflection Sources	MTB; MTB intensified by DTB; mono DTB; dual DTB;	} Can be displayed alternately in a quasi simultaneous way.

Ext. through Ch.A;	}	Selected by MTB trigger source selector
Ext. through Ch.B;		
Ext. through EXT MTB trigger		
input;		
Line		

Trace Separation:		Between MTB INTENSified and (mono or dual) DTB.
Max. Separation	at least 4 div	Symmetrical: (MTB shifting upwards, DTB downwards).
Minimum Shift Range	+ or - 5 unexpand. div.	From screen center.
Deflection coefficient		
Ch.A or Ch.B	see 2.2.3.	Except error limit
EXT	100mV/div	
EXT:10	1V/div	
Error Limit	+ or - 5%	For all sources except LINE.
Dynamic Range	20 div	Measured at 50kHz; Compression at limits of dynamic range: 6%.
Maximum Linearity Error	5%	Measured at 1KHz
Line Deflection	7 +or- 1,5 div	49Hz < line Frequency < 61Hz.
Frequency Response:		
- Lower Transition Point of BW	see appropriate Channel	Input coupling of Ch.A or B and coupling of MTB trigger are cascaded.
- Upper Transition Point of BW	2MHz (-3dB)	
Max. Phase Diff. between Hor. and Vert.	3°	Up to 100kHz
Max. Horizontal Dis- play Instability		
- Drift	0,1 div/h	
- Temp. Coefficient	0.05div/K	

## 2.2.6. MAIN TIME BASE

Modes	repetitive	Auto Bright Base Line occurs, when in AUTO Trigger Mode and if during >0,1s no triggerable signal is available.
	single	
Deflection coefficient		Measured over Central 8 unmagnified divisions
- TB Magnifier: OFF		
Steps	20 ns/div... 1 s/div	In a 1-2-5 sequence of 24 steps
Error Limit (Ambient: 5...40°C)	+ or - (0,5% of full scale + 1% of reading)	Add 0,5% of full scale for 20ns/ div...50ns/div Add 0,5 % of full scale for Ambient: 0...50°C
- TB Magnifier: x10		
Steps	2 ns/div... 0,1 s/div	In a 1-2-5 sequence of 24 steps
Error Limit (Ambient: 5...40°C)	+ or - (1% of full scale + 1,5% of reading)	Add 0,5 % of full scale for Ambient: 0...50°C
- Vernier Ratio	2,5:1	Uncalibrated, contin. variable between steps.
TB Magnification (Hor. Expansion):	10x	
Max. Expansion Unbalance	+ or - 0,4 unexpand. div	When switching from x10 to x1, the center display will not shift more than stated value.
Minimum Visual Display Length	10 unexpanded div	At Normal Intensity.
Variable Hold Off:		
Minimum	1us or 2 div of MTB setting	Whichever is greater
Maximum	6x minimum Hold Off	
Gate Out:		Available at BNC on rear of instrument.
Output impedance	2,3 k.0hm	
Time Base not running	0V<Output<0,4V	Maximum Current Sink: 2mA
Time Base running	2,4V<Output<5V	Maximum Current Supply: 400uA.

## 2.2.7. DELAYED TIME BASE

Modes	Mono DTB;	
	Dual DTB;	DTB is displayed twice (alternately), Delta T being the time difference between both DTB displays.
	DTB starting; DTB triggering on first event	after Delay Time.
Deflection Coefficient:		Measured over central 8 unmagnified divisions
- TB Magnifier: OFF		
Steps	20ns/div... 0,5 s/div	In a 1-2-5 sequence of 23 steps
Error Limit (Ambient:5...40°C)	+ or - (0,5% of full scale + 1% of reading)	Add 0,5 % of full scale for 20 ns/div...50 ns/div Add 0,5 % of full scale for Ambient:0...50°C
- TB Magnifier: x10		
Steps	2 ns/div... 50 ms/div	In a 1-2-5 sequence of 23 steps
Error Limit (Ambient:5...40°C)	+ or - (1% of full scale + 1,5% of reading)	Add 0.5 % of full scale for Ambient:0...50°C
- Vernier Ratio	2,5:1	Uncalibrated continuously variable between steps.
TB Magnification (Hor. Expansion):	10x	
Max. Expansion Unbalance	+ or - 0.4 unexpand. div	When switching from x10 to x1, the center display will not shift more than stated value.
Delay Time:	20ns...10s	In 24 steps; continuously variable between steps.
- Error Limit (Ambient:5...40°C)	+ or - (1,2% of full scale + 1% of reading + 12ns)	MTB Vernier in CAL position Add 1 % of full scale for Ambient:0...50°C

- Position Range	0,2...9,9 x MTB time/div setting	Minimum delay: 20ns on all ranges
- Resolution	1:65000	Related to full scale of 10 MTB divisions.
- Max. Jitter	0,005%+100ps	(=1 part per 20.000)
Time Difference Delta T:		Dual DTB method.
Range	20ns...10 x MTB time/div setting	
Error Limit (Ambient:5...40 C)	+ or - (0,1 % of full scale + 0,5% of reading + 2ns)	Add 0,05% of full scale for first and last 10% of available range Add 0,5% of full scale +1% of reading for ambient:0...50°C
Gate out:		Available at BNC on rear of instrument.
- Output impedance	2,3 k.Ohm	
- Time Base not running	0V<Output<0,4V	Maximum Current Sink: 2mA.
- Time Base running	2,4V<Output<5V	Maximum Current Supply: 400uA.

## 2.2.8. MTB TRIGGERING

Trigger sources	Channel A; Channel B; Composite (Ch. A & B); External; Line	
Input Connector (Ext. Trigg.)	BNC	
Input Impedance (Ext. Trigg.):		For Frequency >1 MHz see Fig. 2.2.
R parallel	1M.Ohm + or - 1%	In DC position of Input Coupling In AC position of Input Coupling: 18 nF in series with R parallel and C parallel
C parallel	9pF	
Max. Input Cap. Difference	1,5pF	Difference between channel A, Channel B, EXT MTB Trigger and EXT DTB Trigger Inputs

## Coupling

d.c.; a.c.;  
LF rejected;  
HF rejected

Maximum Input Voltage  
(Ext. Trigg.)

300V (d.c. +  
a.c. peak)

Apparatus should be properly grounded through the protective-ground conductor of the power cord.

Up to 1MHz; for Frequency >1MHz: see Fig. 2.3.

## Min. Trigger sensitivity

In TRIGgered mode.

	up to 100MHz	up to ...MHz
Ch.A and Ch.B	0,5div	1div
EXT	50mV	300mV}
EXT/10	0,5V	3V}

... = Up to 200MHz

... = Up to 250MHz

## Slope Selection

positive  
going (+);  
negative  
going (-)

## Level Control Range:

Ch. A and Ch.B	+ or - 8 div
EXT	+ or -0,8V
EXT:10	+ or -8V

NOT TRIG'D led is lit unless triggered.

In TRIG and SINGLE positions of Mode Selector.

## Any Source

related to  
peak value

In AUTO position of Mode Selector.

## Frequency Response:

Trigger not affected by  
Bandwidth Limiter.

Lower Transition  
Point of BW

Channel A or Channel B coupling eventually cascaded with  
Trigger coupling.

d.c.  
10Hz (-3dB) or  
less

Trigger Coupling in DC position  
Trigger Coupling in AC position

20kHz (-3dB)

Trigger Coupling in LF REjected position.

Higher Transition  
Point of BW

50kHz (-3dB)

Trigger Coupling in HF REjected  
position.

See also table  
with trigger  
sensitivities

## 2.2.9. DTB TRIGGERING

Trigger sources

Channel A;  
Channel B;  
Composite (Ch.A  
& B);  
External; End of  
Delay (STARTS mode)

Input Connector  
(Ext/ Trigg.)

BNC

Input Impedance (Ext.  
Trigg.):

For Frequency >1 MHz see  
Fig.2.2

R parallel

1 M.0hm  
+ or - 1%

C parallel

9pF

In DC position of Input Coupling  
In AC position of Input  
Coupling: 18 nF in series with  
R parallel and C parallel

Max. Input Cap.  
Difference

1,5 pF

Difference between Channel A,  
Channel B, EXT MTB Trigger and  
EXT DTB Trigger Inputs.

Coupling

d.c.; a.c.;  
LF rejected;  
HF rejected

Maximum Input Voltage  
(Ext. Trigg.)

300V (d.c. +  
a.c. peak)

Apparatus should be properly  
grounded through the protective-  
ground conductor of the power  
cord.

Up to 1MHz; for Frequency  
>1MHz: see Fig. 2.3.

Min. Trigger  
Sensitivity

up to 100MHz	up to ...MHz
-----------------	-----------------

Ch.A and Ch.B

0,5div	1div
--------	------

EXT:10

0,5V	3V
------	----

Slope Selection	positive going (+) negative going (-)	
Level Control Range:		
Ch.A and Ch.B	+ or -8 div	
EXT	+ or -0,8V	
EXT:10	+ or -8V	
Frequency Response:		Trigger not affected by Bandwidth Limiter.
Lower Transition Point of BW		Channel A or Channel B coupling eventually cascaded with Trigger coupling.
	d.c.	Trigger Coupling in DC position.
	10Hz (-3dB) or less	Trigger Coupling in AC position;
	20kHz (-3dB)	Trigger Coupling in LF REJection position.
Higher Transition Point of BW	50kHz (-3dB)  See also table with trigger sensitivities	Trigger Coupling in HF REJected position.

## 2.2.10. BLANKING OR Z-AXIS

Input connector	BNC	On rear of instrument
Input Impedance	30 k.0hm	When input is 0...2,5V, otherwise >10k. 0hm
Input Coupling	d.c.	
Maximum Input Voltage	+ or - 10V	
Sensitivity:		
Unblanked at	0V	} Half tones are possible at input voltages between 0V and +2,5V.
Blanked at	+ 2,5V or more	
Response Time	20ns	From unblanked to fully blanked, when input is a transient of 0...+2,5V (rise time 2ns or less).

**2**

## 2.2.11. AUTO SETTING

Y Deflection Source	Ch. A and Ch.B	Channel INVERTer not affected by AUTO SET.
Y Deflection Mode		
- MTB at 1ms/div or lower:	CHOPped	
- MTB at 500us/div or higher:	ALternate	
Input Impedance:		
- Accessory with Probe Read Out	according to Probe Read Out	
- otherwise	not affected by AUTO SET	
Y Input Coupling	AC	
Y Deflection:		Each Channel is independently set.
- 10mV < Input at BNC<30V	6 div or less }	Vernier not affected by AUTO SET.
- Input at BNC<10mV	Channel at 200mV/div }	
		Due to trigger uncertainty at Freq. >60 MHz or at Duty Cycle <>50%, sensitivity can deviate from given values, but signal will remain visible on screen.
Y Channel Base Line POSITION	center of screen +0,2div Ch.A -0,2div Ch.B	POSITION control remains "dead" until setting of knob (when turning) represents actual base line on screen.
Band Width LIMiter	OFF	
X Deflection Source	Main Time Base	All other sources switched off.
X POSITION	not affected by AUTO SET	
MTB Trigger Source:		
Triggerable Signal at EXT Input	EXT	

No signal at EXT input,  
but triggerable Signal  
at Channel A or B

Channel A or  
Channel B

Channel with highest V/div  
setting is selected.  
(Channel A when settings are  
equal)

No Triggerable Signal  
at any input

Channel A

MTB Trigger Mode

AUTO

MTB Trigger Coupling

AC

TB MAGnifier

not affected by AUTO SET.

Cursors

Not affected by  
AUTO SET

## 2.2.12. CURSORS

Cursor Intensity Control	independent of trace intensity but combined with setting read out intensity	In SINGLE mode of MTB, cursors are displayed during max. 0,1s when SINGLE button is pushed.
Modes	Independent RATIO TRACK	Cursor reading independent of previous reading Cursor reading in % of previous reading REF cursor and Delta cursor are tracking
Hor. and Vert. Resolution	0,02mm or better	
Read Out Resolution	3 digits	
Voltage Cursors		
- Error Limit	See error limit of vertical deflection coefficients. See chapt. 2.2.3.	Referred to input at BNC, error of probes etc. excluded.
- Minimum Cursor Range	central 7 div.	
- RATIO range	(0,1% to 999%)	100% = Value in Cursor Read Out when Ratio button is pushed.
- Cursor Reference	Absolute Value (V) referred to channel A  Absolute Value (V) referred to channel B  Relative Value (div)	When only Ch.A is displayed or When a combination of channels is displayed, whilst Ch.B is not MTB trigg. source. Probe factor included, when probe is provided with probe read-out.  When only Ch.B is displayed or when a combination of channels is displayed, whilst Ch.B is MTB trigg. source. Probe factor included, when probe is provided with probe read-out.  When reference channel is in UNCAL position or When only Trigger View is displayed or when instrument is in X vs. Y deflection mode

Time Cursors		In MTB mode only
- Error Limit	see Error limit of MTB deflection coefficients	see section 2.2.6
- Minimum Cursor Range:	Central 9 div	
- RATIO Range	(0,1% to 999%)	100% = Value in Cursor Read Out, at the moment RATIO button is pushed.
- Cursor Reference	Absolute Value (s,Hz) referred to MTB	When Main Time Base is in CAL position.
	Relative Value (div)	When Main Time Base is in UNCAL position or when instrument is in X vs Y mode.

### 2.2.13. SETTING READINGS ON CRT

Modes	Settings only	}
		}
	Cursors only	} Incl. Cursor Readings
		}
	Settings + Cursors	}
		}
Intensity Control of CRT text	independent of trace intensity but combined with cursor intensity	In SINGLE position of MTB, setting readings are displayed during max. 0,1s when SINGLE button is pushed.
Vertical settings	Defl. coefficient AC, DC, Ground Invert, UNCAL, 50 ohm	
Horizontal Settings	MTB deflection coefficient.	In MTB, MTB-INTENS and alternate sweep mode.
	DTB deflection coefficient.	In DTB and alternate sweep mode.
	Delay (1/Delay)	s or Hz
Trigger level (in TRIG and SINGLE) when d.c. coupled	in volt (2 digits)	When supplied with IEEE option Chann. + Trigg. coupl. both d.c
when a.c. coupled	in div (2 digits)	Chann. or Trigg. coupl. in a.c

## 2.2.14. CALIBRATOR

Wave Form:		
Shape	square wave	
Internal Impedance	50 Ohm + or - 1%	
Output Voltage (peak to peak)	0,8V + or - 1% pos. going with respect to ground	Open Voltage: halves when terminated into 50 Ohm.
Output Current (peak to peak)	16mA + or - 2%	When output short circuited; halves when terminated into 50 Ohm.
Frequency	5kHz + or - 0,1%	

## 2.2.15. POWER SUPPLY

Source Voltage a.c.  
(r.m.s.)

Nominal 100V...240V

Limits of Operation 90V...264V

Source Frequency

Nominal 50 Hz...400 Hz

Limits of operation 45 Hz...440 Hz

Source Waveform characteristics:

At Nominal Source Voltage

Max. Waveform Deviation Factor 10%

Crest factor 1,27...1,56

Allowable Power

Source Interruption: At least 20ms

At nominal source Voltage.  
After this time Oscilloscope Settings are saved before instrument goes down. Automatic Power Up after restoration of Power Line Voltage. (For Setting Retention see 2.2.16.)

Power Consumption  
(a.c. source)

Typical 135W  
Limits of Operation 138W

Options excluded

## 2.2.16. SUNDRIES

## Settings Retention:

When instrument is switched off  
or during Line Power failure.

- Memory Back Up Voltage 2V...3,5V

- Memory Back Up Current Drain typical 0,1uA At 25°C.

- Recommended Batteries:

type LR 6

According to IEC 285, (= Alkaline Manganese Penlight Battery). e.g. PHILIPS LR6 or DURACELL MN 1500

quantity 2pcs

- Temperature Rise of batteries 20K

After warming up period of instrument.

- Retention Time typical 2 years At 25°C, with recommended (fresh) batteries.

Temperature Range -30°C...+70°C

At -40°C...-30°C Settings Retention is uncertain. It is advised to remove batteries from instrument when it is stored during longer periods (>24h) below -30°C or above 60°C. N.B! UNDER NO CIRCUMSTANCES BATTERIES SHOULD BE LEFT IN THE INSTRUMENT AT TEMPERATURES BEYOND THE RATED RANGE OF THE BATTERY SPECIFICATION!

Finish of housing epoxy powder coated

Printed Circuit Boards glass laminate epoxy

Cooling fan aided convection

Maintenance free.

## 2.2.17. ENVIRONMENTAL CHARACTERISTICS

The environmental data mentioned in this manual are based on the results of the manufacturer's checking procedures. Details on these procedures and failure criteria are supplied on request by the PHILIPS organisation in your country, or by PHILIPS, INDUSTRIAL & ELECTRO-ACOUSTIC SYSTEMS DIVISION, EINDHOVEN, THE NETHERLANDS.

Meets Environmental Requirements of MIL-T-28800C Type III Class 5, Style D

## Temperature

Memory back Up Batteries removed from instrument, unless batteries meet temperature specifications (see also 2.2.16).

## - Operating:

Min. Low Temperature 0°C

Cf. MIL-T-28800C par. 3.9.2.3. tested cf. par 4.5.5.1.1.

Max. High Temperature +50°C

Cf. MIL-T-28800C par. 3.9.2.4. tested cf. par 4.5.5.1.1.

- Non Operating:  
(Storage)

Min. Low Temperature -40°C

Cf. MIL-T-28800C par. 3.9.2.3. tested cf. par. 4.5.5.1.1.

Max. High Temperature +75°C

Cf. MIL-T-28800C par. 3.9.2.4. tested cf. par 4.5.5.1.1.

## Maximum Humidity:

Operating and Non Operating (Storage) 95% Relative Humidity

Cf. MIL-T-28800C par. 3.9.2.2. tested cf. par. 4.5.5.1.1.

## Maximum Altitude:

Cf. MIL-T-28800C par. 3.9.3. tested cf. par 4.5.5.2.

Memory Back Up Batteries removed from instrument, unless batteries meet Maximum Altitude specs.

- Operating 4,5km (15000 feet)

Maximum Operating Temperature derated 3°C for each km (for each 3000 feet) above sea level.

- Non Operating (Storage)	12km (40000 feet)	
Vibration (Operating)		Cf. MIL-T-28800C par 3.9.4.1. tested cf. par. 4.5.5.3.1.
- Freq. 5...15Hz:		
Sweep Time	7 min	
Excursion (pk to pk)	1,5mm	
max. Accele- ration	7m/s <sup>2</sup> (0,7g)	At 15Hz
- Freq. 15...25Hz		
Sweep Time	3min	
Excursion (pk to pk)	1mm	
max. Accele- ration	13m/s <sup>2</sup> (1,3g)	At 25Hz
- Freq. 25...55Hz:		
Sweep Time	5min	
Excursion (pk to pk)	0,5mm	
max. Accele- ration	30m/s (3g)	At 55Hz
- Resonance Dwell	10min	At each resonance freq. (or at 33Hz if no resonance was found). Excursion cf. 20.06.01. to 20.06.03.
Shock (Operating)		Cf. MIL-T-28800C par. 3.9.5.1. tested cf. par. 4.5.5.4.1.
- Amount of shocks		
total	18	
each axis	6	(3 in each direction)
- Shock Wave Form	half sine wave	
- Duration	11ms	
- Peak Acceleration	300m/s <sup>2</sup> (30g)	
Bench Handling		Cf. MIL-T-28800C par. 3.9.5.3. tested cf. par. 4.5.5.4.3.
Meets requirements of	MIL-STD-810 method 516, proced. V	
Salt Atmosphere:		Cf. MIL-T-28800C par. 3.9.8.1. tested cf. par. 4.5.6.2.1.

2

Structural parts meet requirements of MIL-STD-810 method 509, proced. I salt solution 20%

EMI (Electro Magnetic Interference)

meets requirements of MIL-STD-461 Class B  
VDE 0871 and VDE 0875 Grenz-wertklasse B

Applicable requirements of Part 7: CE03, CE07, CS01, CS02, CS06, RE02, RS02, RS03.

Magnetic Radiated Susceptibility:

Tested conforming IEC 351-1 par. 5.1.3.1.

Maximum Deflection Factor

7mm/mT (0,7mm/gauss)

Measured with instrument in a homogeneous magnetic field (in any direction with respect to instrument) with a Flux Intensity (peak to peak value) of 1,42mT (14,2 gauss) and of Symmetrical Sine wave Form with a Frequency of 45...66Hz.

## 2.2.18. SAFETY

Meets requirements of IEC 348 Class I

VDE 0411

Expect for power cord, unless shipped with Universal European power plug

UL 1244  
CSA 556B }

Expect for power cord, unless shipped with North American power plug

## 2.2.19. ACCESSORIES

Accessories furnished with instrument

2x10:1 passive probe PM8929/99

10 M.0hm, 10:1 Passive Probe with read Out (1m).

PM9310

Collapsible Viewing Hood

Blue Contrast Filter

Factory installed

Operating Manual

Front Cover

Fig.2.2. Input resistance  $R_{par.}$  and capacitance  $C_{par.}$  versus frequency.

Fig.2.3. Maximum input voltage (peak to peak) derating versus frequency.

## 2.2.20. SETTINGS MEMORY (ONLY FOR PM3286A)

## Memory size

Standard	max. 75 complete front panel settings
----------	--

## Functions

Settings	Save	Actual settings are stored in memory, replacing content of memory cell indicated on CRT
	Insert	Actual settings are stored in memory; insertion is after memory cell indicated on CRT
	Delete	Content of memory cell indicated on CRT is deleted.
	Recall	Actual settings are replaced by content of memory cell indicated on CRT. Actual settings are saved in "last setting" memory (= mem. cell # 0)
	(Recall) Next	Actual settings are replaced by content of memory cell indicated on CRT increased by 1 (empty cells are skipped). Actual settings are saved in "last setting" memory (= memory cell # 0)
	(Recall) Previous	Actual settings are replaced by content of memory cell indicated on CRT decreased by 1 (empty cells are skipped). Actual settings are saved in "last setting" memory (= memory cell # 0)

## Memory

Protect	Memory is write protected
Unprotect	Memory is not write protected
Identify (#0...9)	Instrument is individualised, no response to transmitter unless having some identifier #

## Remote control

AUTO setting	Pushing AUTO on transmitter has same result as pushing AUTO button on front panel of instrument, unless instrument is in remote control.
--------------	--

## Transmitter

Transmission type	Infra Red	
Batteries	type R03P	
	number 4 pcs.	
	life typical 2 years	At normal use
Max. Transmission distance	typical 3,5 m	At an angle of max. 5° off axis
Max. Transmission angle	vert. +or- 45° off axis	} At distance of 0,5 m on axis
	hor. +or- 35° off axis	
Dimensions	length 173 mm (6.8 in)	
	width 71 mm (2.6 in)	
	height 16 mm (0,6 in)	
Mass	135 g	Batteries included.
Environmentals		
oper. temp. range	+ 5...+45 °C	
Stor. temp. range	-25...+70°C	Without batteries, unless batteries withstand this temperature range.
Resistance to liquid agents	splash proof	No functional failure after drying 24 h.

## **INTRODUCTION TO CIRCUIT DESCRIPTION AND DESCRIPTION TO BLOCK DIAGRAM**

INTRODUCTION TO CIRCUIT DESCRIPTIONS AND DESCRIPTION OF BLOCK DIAGRAM. 3.

3

CONTENTS

3. INTRODUCTION TO CIRCUIT DESCRIPTIONS AND BLOCK DIAGRAM DESCRIPTION.

3.1. Introduction to circuit descriptions.	3-1
3.2. Block diagram description.	3-10

FIGURES

3.1. Block diagram.	3-6
---------------------	-----

### 3. INTRODUCTION TO CIRCUIT DESCRIPTION AND BLOCK DIAGRAM DESCRIPTION.

#### 3.1 INTRODUCTION TO CIRCUIT DESCRIPTION.

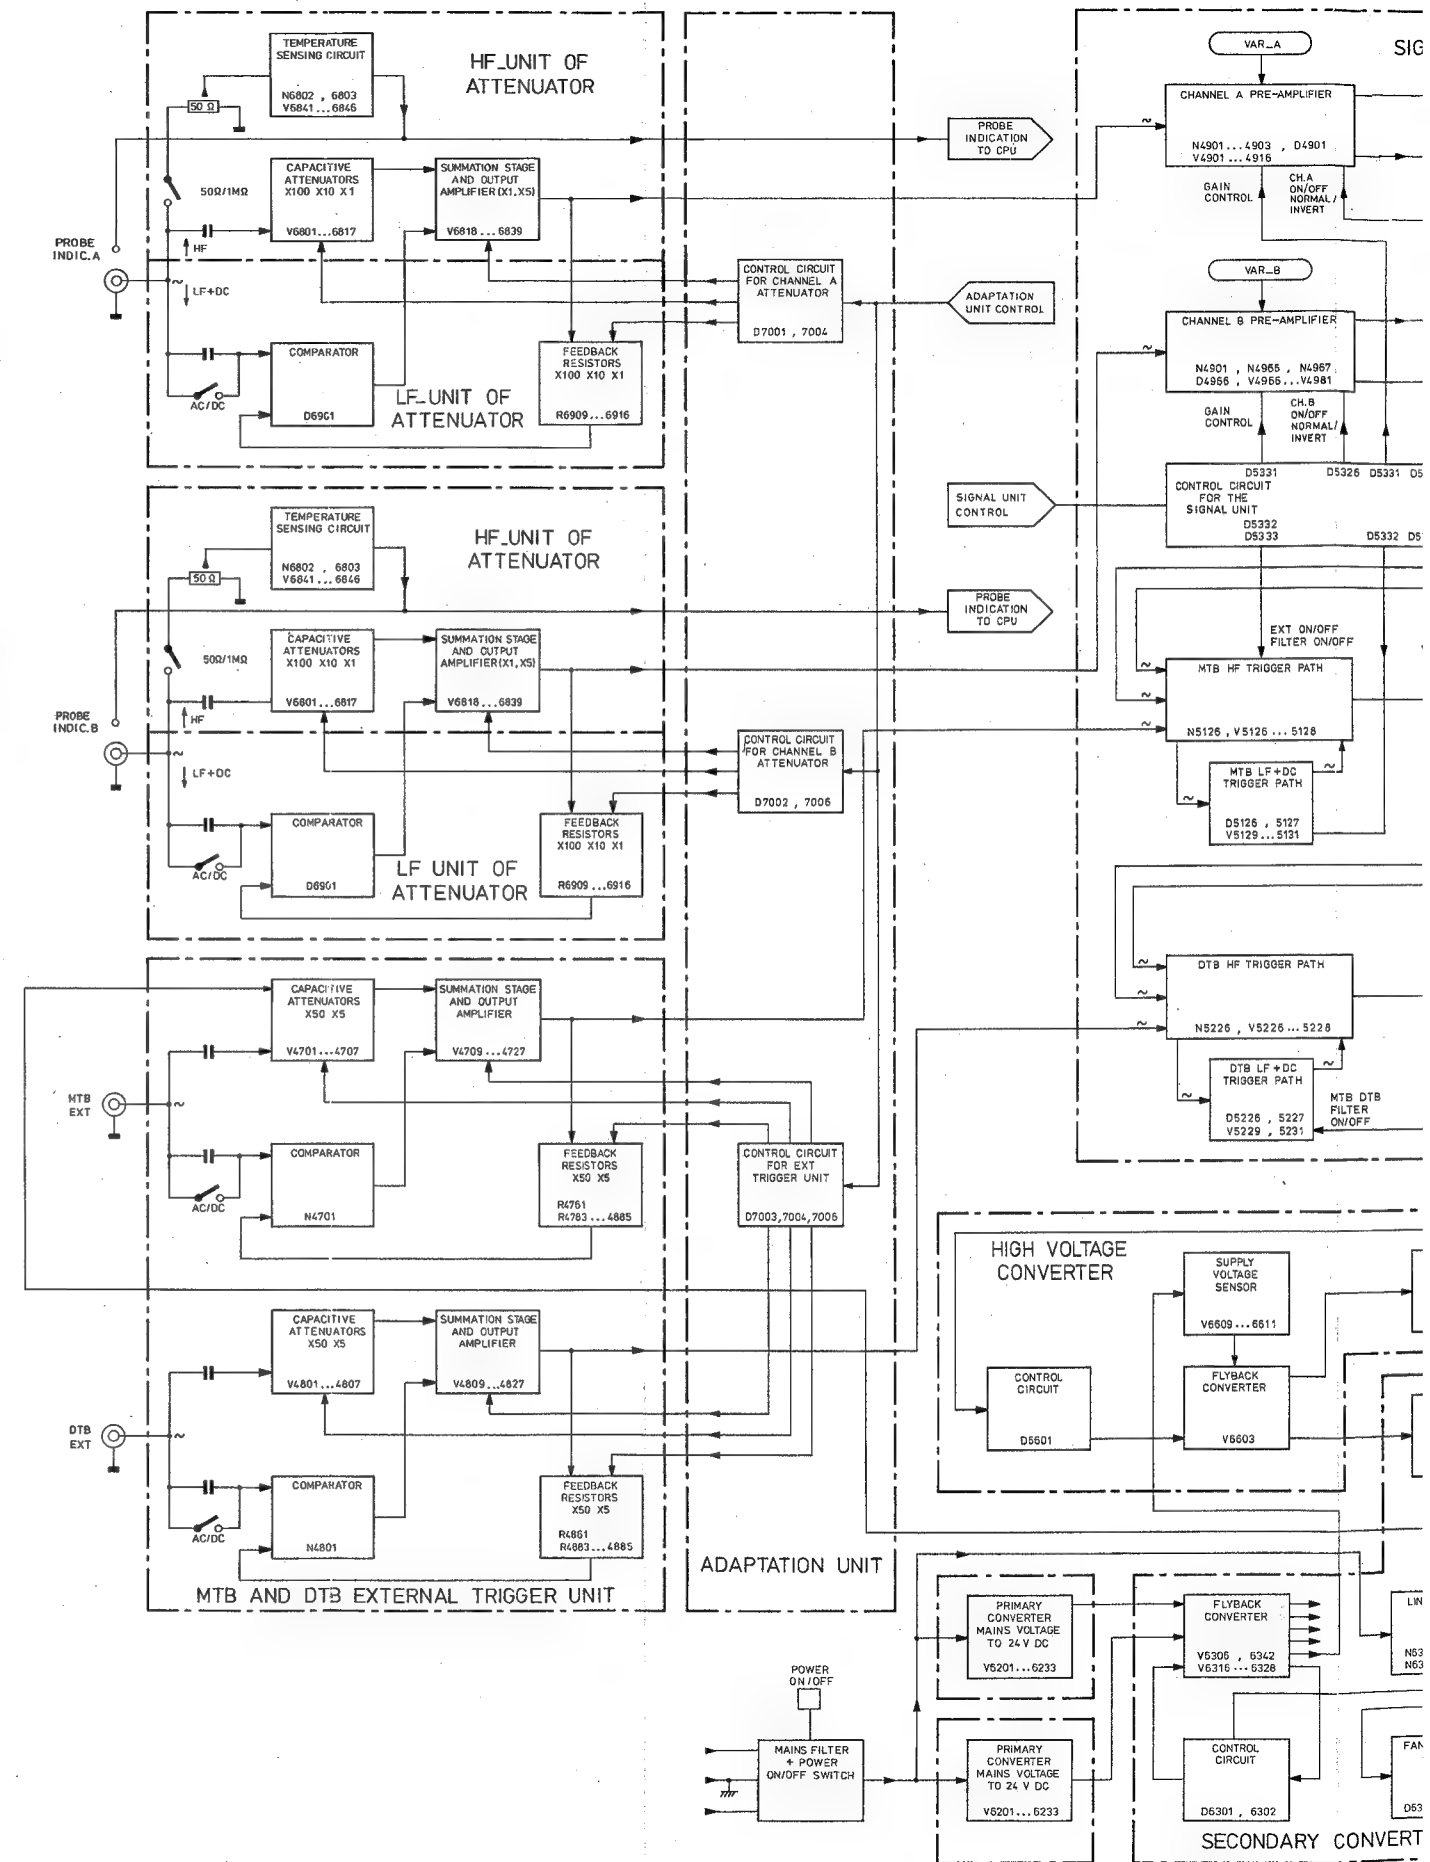

The functioning of the circuits is explained per printed circuit board (p.c.b.). For every p.c.b. a separate chapter is available containing the lay-out of the p.c.b., the belonging circuit diagram (s) and the circuit description.

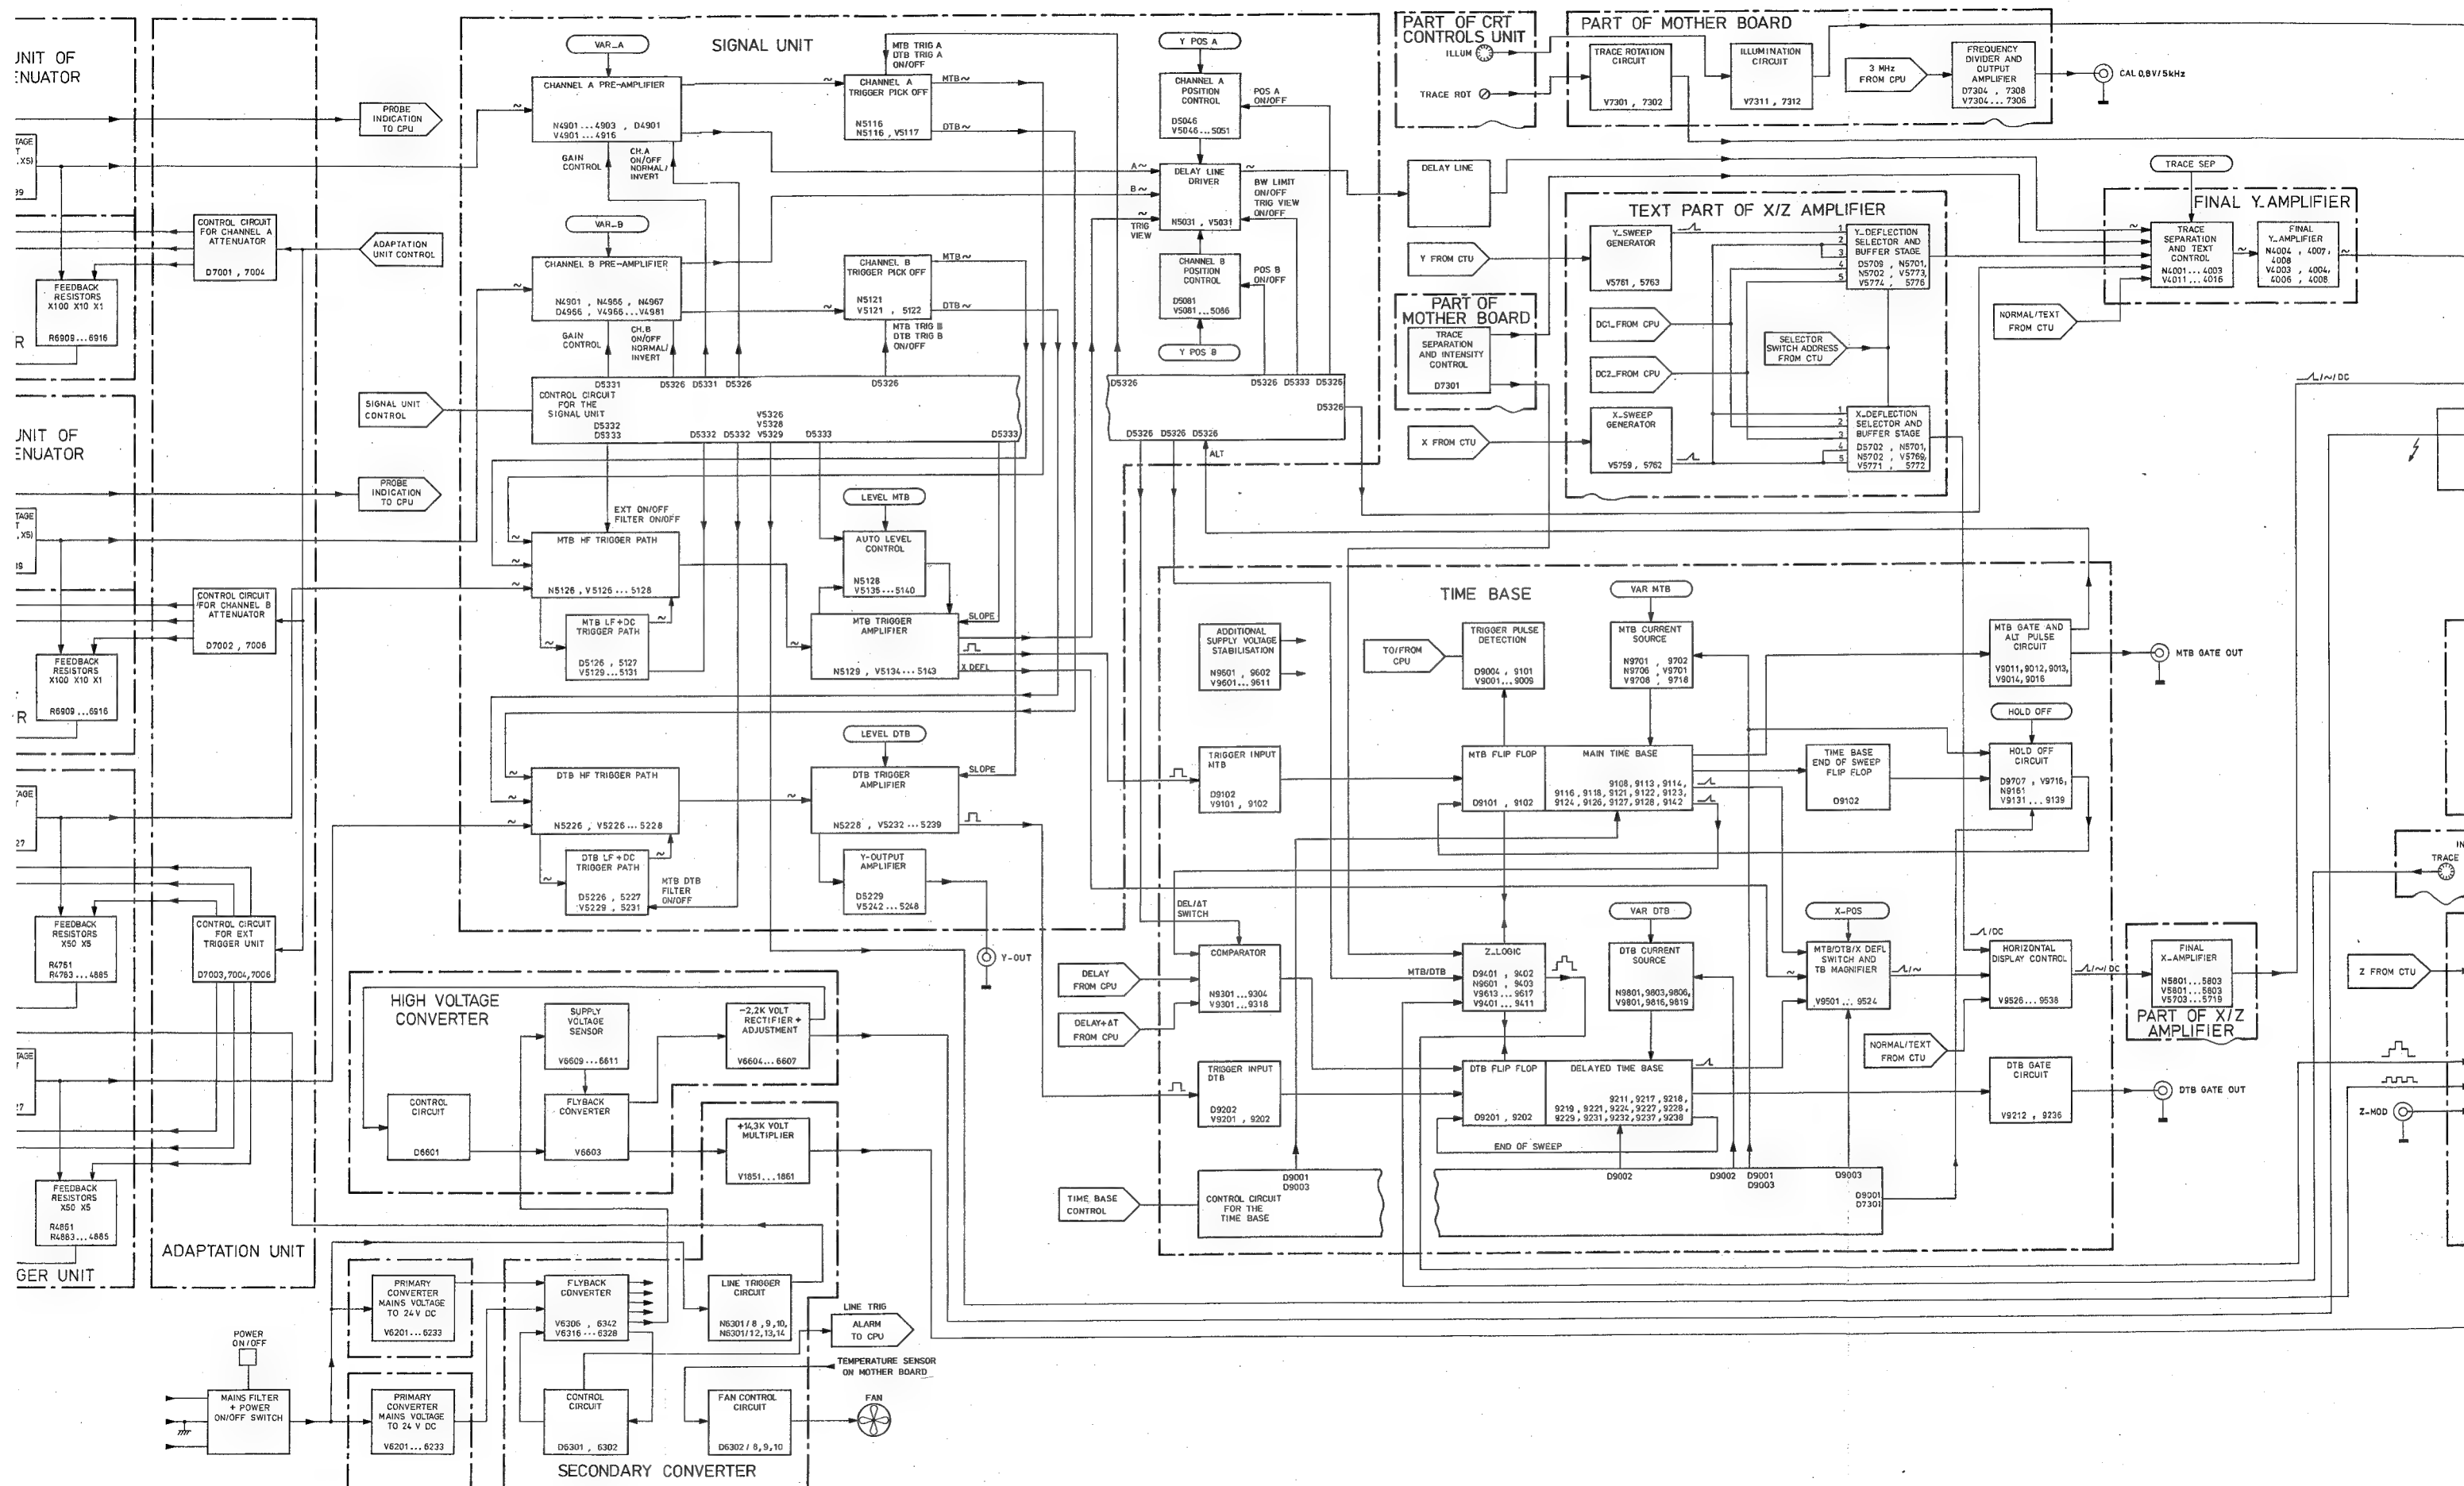

Location of electrical parts.

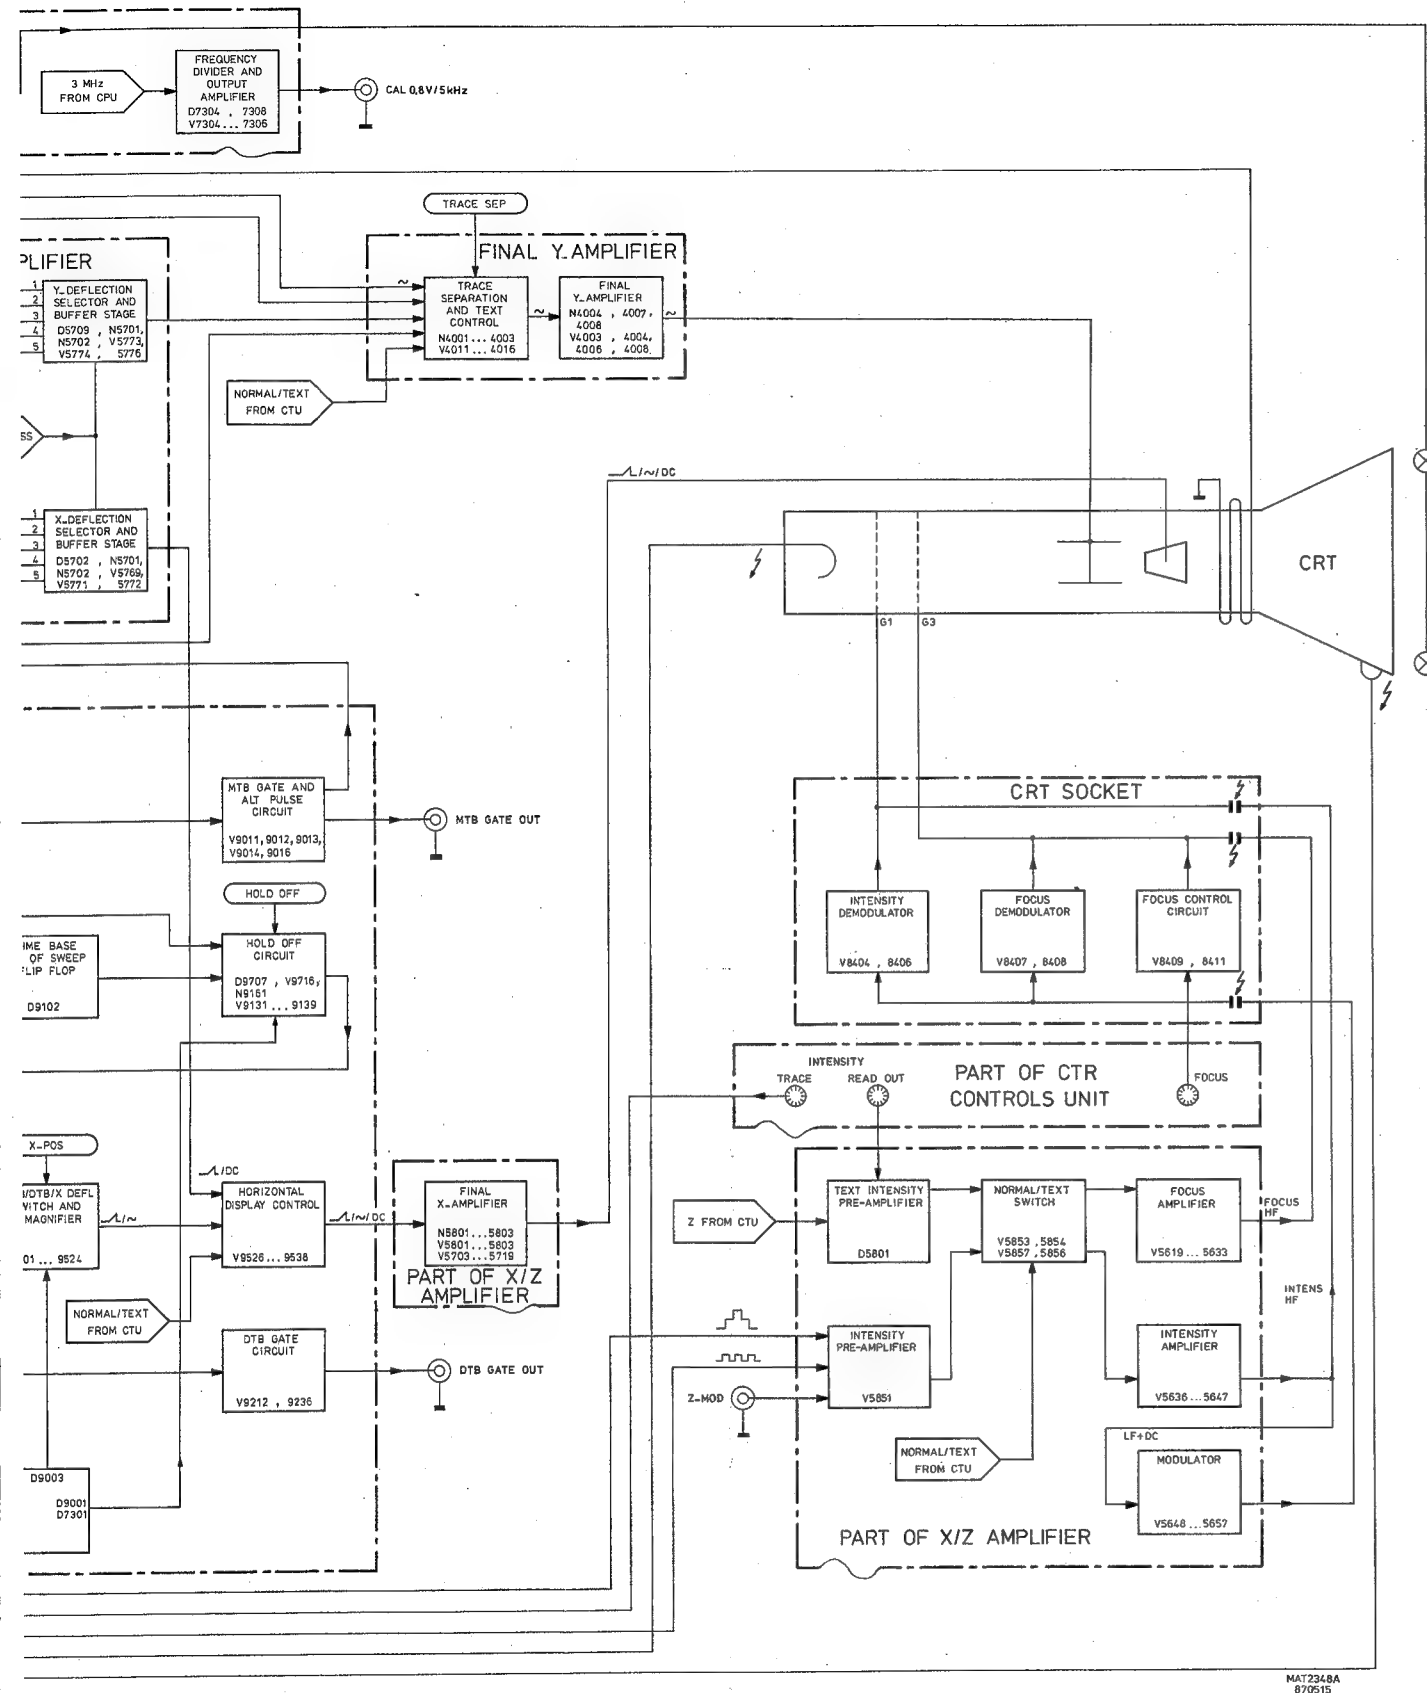

The itemnumbers of C..., R..., V..., N..., D... and K... have been divided into groups which relate to the circuit, the printed circuit board according to the following table:

Itemnumber	Printed circuit board	Figure
101- 199	LCD-unit	4.1, 4.2
501- 599	Switch unit	5.2, 5.3
1101-1199	Intermediate unit	6.2, 6.3
1601-1699	Central processor unit	7.2, 7.3, 7.4, 7.5
4001-4099	Final Y amplifier	14.1, 14.2
4701-4799	MTB external trigger unit	11.1, 11.2
4801-4899	DTB external trigger unit	11.1, 11.3
4901-5399	Y-signal unit	13.1, 13.2, 13.3, 13.4
5601-5899	X/Z amplifier and chip unit	16.1, 16.2, 16.3
5901-5999	CRT-controls unit	22.1, 22.2
6000-6100	Infra Red receiver (PM3286A)	22.3, 22.4
6201-6299	Primary converter unit	18.3, 18.4
6301-6399	Secondary converter unit	19.4, 19.5
6601-6699	High voltage converter unit	20.2, 20.3
6801-6899	HF-attenuator unit	10.1, 10.2
6901-6999	LF-attenuator unit	10.4, 10.3
7000-7050	Adaptation unit	12.1, 12.2
7301-7399	Mother Board	21.1, 21.2
8001-8099	IEEE 488 bus unit (optional)	9.1, 9.2, 9.3
8201-8299	CRT text unit (optional)	8.1, 8.2, 8.3
8401-8499	CRT-socket unit	17.1, 17.2
9001-9899	Time-base and time base chip-unit	15.10, 15.11, 15.12, 15.13, 15.14

NOTE: In the circuit diagrams you can find several signal names. Some of them have a line on top which means that the signal is low if the related function is on. In these circuit descriptions the line on top of the signal name is not present; it is replaced by the addition "-" directly behind the signal name.

### 3.2 BLOCK DIAGRAM DESCRIPTION (see fig. 3.1.)

Note: this block diagram is a universal one. This means that it is based upon the PM3286A which is the most extensive instrument of the 200 MHz-oscilloscope family. In PM3285A, the infra-red transmitter and receiver blocks are not present.

#### 3.2.1. Introduction

This block diagram description is based around all the important functional blocks and their interconnections. In order to assist in cross-reference with the circuit diagrams, the blocks include the item numbers of the active components they contain. Furthermore, the blocks are grouped together per printed-circuit board, or a part of it. To facilitate reference, the names of the functional blocks and p.c.b. units are given in text in CAPITALS. Signal waveforms are also indicated at block interconnections where useful.

In this instrument almost all the controls (potentiometers, pushbutton switches and rotary switches) influence the oscilloscope circuits via a microcomputer (uC) system: as a result, the position of the controls is monitored by the uC, which adjusts the time-base, input attenuators, etc. accordingly to the desired value. For this purpose, control circuits are present at different points in the instrument; e.g. on the y-signal unit, the time-base and in the vicinity of the input units for channel A, B and external triggering.

The control circuits themselves are controlled by the uC. If the IEEE option is installed, an external controller is capable of controlling the instruments functions.

Via the IEEE-bus the controller can also take-in the settings of a complete front panel. If the instrument is equipped with a remote control (option present in PM3286A), a number of complete "front panels" can be activated to control the oscilloscope.

Another optional unit is the CRT TEXT unit. This unit writes text; e.g. time base and attenuator settings, and also cursors on the c.r.t. screen. During a normal signal display cycle, this cycle is interrupted while text is written. For this purpose, the inputs of the final vertical (Y) amplifier, final horizontal (X) amplifier and the intensity (Z) amplifier are then switched to the X, Y and Z outputs of the TEXT unit.

The MOTHER BOARD of the instrument is a p.c.b. with only few components, but it plays a vital role as a connecting system for control signals between the oscilloscope circuits and the uC. The unit also distributes the supply voltages from the power supply to various oscilloscope circuits. Most p.c.b.'s are connected to the MOTHER BOARD.

#### 3.2.2. Front unit

This unit incorporates the necessary circuits to control the oscilloscope functions. It consists of a number of p.c.b.'s. located one behind the other in parallel with the front text plate. The CENTRAL PROCESSOR UNIT (CPU) forms the heart of the front unit. The p.c.b.'s. of the front unit are now described in order from the text plate.

### LCD unit

This unit incorporates the LCD read-outs for the sensitivity of the vertical channels and the positions of the MTB and DTB and the delay time. The block LCD DRIVERS is controlled by the CENTRAL PROCESSOR UNIT and incorporates separate drives for each LCD.

### Switch unit

This p.c.b. mainly includes the front-panel pushbutton switches. Depending on the instrument version, a maximum of 64 switches can be read-out by the CENTRAL PROCESSOR UNIT. Each pushbutton contains a LED to indicate when the function is on, controlled by the CPU via the LED DRIVERS.

The SWITCH UNIT also contains a number of infra-red LEDs, which help to read-out the rotary switches on the INTERMEDIATE UNIT.

### Intermediate unit

This p.c.b. incorporates a number of potentiometers and the rotary switches Y AMPL for the vertical channels, DEL'D TB, DELAY or DELTA T and MAIN TB.

#### Rotary switches

They are contactless, optical switches. A disc with holes is directly-coupled to the control knob. A pair of infra-red LED's located on the SWITCH UNIT shine through the holes on to a pair of photo-transistors. These photo-transistors are part of the block POSITION DETECTORS FOR THE OPTICAL SWITCHES. If the disc is rotated, the light beams are interrupted between holes in an on/off/on/off sequence. This results in a pulse pattern at the photo-transistors. The number of pulses is a measure of the number of steps that the control knob has made. By using two photo-transistors per knob, it is possible to detect the direction of rotation of the knob: this information is given by the phase difference between the pulses at the two photo-transistors. If a rotary switch is operated, the POSITION DETECTORS FOR THE OPTICAL SWITCHES send a signal to the CENTRAL PROCESSOR UNIT. After this, the number and phase of the pulses can be read by the processor.

#### Potentiometers

The signals from the potentiometers HOLD OFF, TRACE SEP, X POS and LEVEL DTB are directly routed to the outputs of the unit. The signals from the potentiometers Y POS A, Y POS B and LEVEL MTB are applied to the block NORMAL/FIXED POTENTIOMETER SELECTION. The three outputs in this block are either connected to the associated potentiometer (normal mode) or to a fixed d.c. voltage (after the AUTO SET mode initiated). The block POTENTIOMETER POSITION DETECTION CAL/FIXED detects for the Y POS A, Y POS B or LEVEL MTB (selected by the CPU) whether one of them is moved (after AUTO SET selected) through its mid-position. If so, the CPU is informed via the block POSITION DETECTORS FOR THE OPTICAL SWITCHES, with the result that the potentiometer is active again.

The block POTENTIOMETER POSITION DETECTION CAL/FIXED detects positional state of the potentiometers VAR A, VAR B, VAR MTB or VAR DTB (selected by the CPU); i.e. whether one is in its calibrated position. This information is also routed to the CPU.

### Central processor unit (CPU)

The CENTRAL MICROCOMPUTER on this p.c.b. controls all the circuits in the instrument. In addition, it also controls the microcomputers on the IEEE UNIT and the CRT TEXT UNIT.

The CENTRAL MICROCOMPUTER has the following inputs:

- A control signal from the infra-red receiver (present in PM3286A)
- PROBE INDICATOR signals for the vertical channels A and B. These inform the microcomputer of the types of probes connected to vertical inputs sockets A and B, and adapt the sensitivity of the read-out of the LCDs to them. Any overload of the attenuator 50-ohm input resistors is detected via these inputs.
- ALARM signal from the power supply. This signal ensures that the microcomputer saves important information (e.g. front-panel settings) in its memory (with battery back-up) in the event of power switch-off or failure.
- A signal input from the INTERMEDIATE UNIT defining the position of the rotary switches and potentiometers.
- A signal from the IEEE UNIT (if fitted) to determine the potentiometer positions.

The following output signals are available:

- A 3MHz microcomputer clock pulse. This signal is divided on the MOTHER BOARD to generate a 5 kHz CAL signal.
- A signal for the CONTROL CIRCUIT on the Y signal unit, the time-base and for the vertical input unit and the MTB/DTB external trigger input unit.
- A control circuit for the INTERMEDIATE UNIT blocks NORMAL/FIXED POTENTIOMETER SELECTION and POTENTIOMETER POSITION DETECTION CAL/FIXED.
- A control signal to switch the LEDs on the SWITCH UNIT. The pushbuttons on this unit are read via the PUSHBUTTON SWITCH READ-OUT block.
- A control signal for switching the LCD segments on the LCD UNIT.
- Control signals from the EXTERNAL ADDRESS/DATA BUS CONTROL block enable communication between the microcomputer and the IEEE UNIT or the CRT TEXT UNIT.
- Control signals from the microcomputer to the TRIPLE DIGITAL-TO-ANALOG CONVERTER.

This block converts digital information from the microcomputer into three separately controllable output d.c. signals.

These signals provide potentiometer position detection on the IEEE UNIT and start the DTB (after delay time or delay + delta t time) in the COMPARATOR block on the TIME BASE. This block also determines the position of the cursor lines via the signals DC1 and DC2.

### CRT text unit

This unit communicates with the CENTRAL PROCESSOR UNIT via the INPUT BUFFERS block. The TEXT MICROCOMPUTER forms the heart of the unit. This block interrupts the normal signal display cycle momentarily if text has to be written on the c.r.t. screen. This is initiated by the output signal NORMAL/TEXT, which interrupts the normal signals for the final Y amplifier, the final X amplifier and the intensity amplifier.

At the same time, the TEXT GENERATOR produces its own raster by starting a slow sweep ("frame TB") which is applied to the final Y amplifier, and a number of fast sweeps ("line TB") applied to the final X amplifier. As a result, it writes a number of horizontal lines on the screen. The related intensity information applied to the INTENSITY GENERATOR is again generated by the TEXT GENERATOR. The composition of the text is identical to the composition of a television picture.

#### IEEE unit (optional)

This unit incorporates a digital part and an analog part, the latter being used for IEEE-control of the potentiometers. The heart of the unit consists of the IEEE CONTROL LOGIC that communicates with the CENTRAL PROCESSOR UNIT. This block contains all the circuits required to communicate with the system-bus instruments via the IEEE connector on the rear-panel of the instrument. The IEEE CONTROL LOGIC controls the analog part of the IEEE UNIT via the block "INTERFACE BETWEEN DIGITAL AND ANALOG PART".

The analog part serves two purposes:

- It detects the potentiometer positions and routes this information to the IEEE controller. The POTENTIOMETER POSITION DETECTION IEEE block selects one potentiometer for this purpose. The voltage signal from the potentiometer is compared with a sawtooth voltage from the TRIPLE DIGITAL-TO-ANALOG CONVERTER. If the instantaneous value of the sawtooth equals that from the potentiometer a signal is sent to the CENTRAL MICROCOMPUTER which then registers the potentiometer position since it is also aware of the instantaneous value of the sawtooth (The DAC is controlled by the microcomputer).

- It brings the potentiometer functions under control of the IEEE, whereupon the front-panel controls have no influence. For this purpose the PROGRAMMABLE VOLTAGE SOURCES block contains several voltage sources, one for each potentiometer that must be taken over. These voltage sources are loaded with a d.c. voltage generated by the output of the TRIPLE DIGITAL-TO-ANALOG CONVERTER on the CENTRAL PROCESSOR UNIT.

The LOCAL/REMOTE SWITCH block permits the oscilloscope circuit to be connected to its associated potentiometer (e.g. Y-POS A) in local mode, or with one of the programmable voltage sources in remote (IEEE) mode.

NOTE: if the IEEE UNIT is not installed, the potentiometer outputs from the INTERMEDIATE UNIT are directly connected to their associated circuits in the oscilloscope.

#### 3.2.3. Vertical attenuator unit

Since channel A and B attenuator units are identical, only channel A is described. The input signal is applied to the vertical input socket. From here the signal is split up into two components; namely:

- the HF (high frequency) component applied to the CAPACITIVE ATTENUATORS block, which gives signal attenuation of  $\times 100$ ,  $\times 10$ , or  $\times 1$ ,
- the LF and DC (low-frequency and direct current) components applied to the COMPARATOR block. In the input of the COMPARATOR, a d.c. blocking capacitor is present for the AC-coupled mode. This capacitor is short-circuited by a switch contact in the DC-coupled mode.

The output signals from the CAPACITIVE ATTENUATORS and from the COMPARATOR are added and amplified by the SUMMATION STAGE AND OUTPUT AMPLIFIER. This block also enables x5 gain increase for the highest input sensitivity of the instrument. The output signal is routed to the SIGNAL UNIT. A part of the output signal is fed back via the FEEDBACK RESISTORS block to the input of the COMPARATOR where it is compared with the LF and DC components in the input signal. Various feedback resistors can be selected in the FEEDBACK RESISTORS block. This occurs simultaneously with the selection of the attenuation coefficients of the CAPACITIVE ATTENUATORS.

The input impedance of the attenuator unit can be changed from 1M.0hm to 50 Ohm if the 50-Ohm termination resistor is switched on. If the dissipation in this resistor is excessive, the TEMPERATURE SENSING CIRCUIT gives an alarm to the central micro processor. This alarm is routed via the line that is also used for the probe indicator.

All blocks that are capable of working in different modes (e.g. different attenuation coefficients) are controlled via a CONTROL CIRCUIT from the central microprocessor. This CONTROL CIRCUIT block is not located on the attenuator unit, but is on a separate unit - the ADAPTATION UNIT. The attenuator unit circuits are located on two p.c.b.'s: an HF (high-frequency) unit and an LF (low frequency) unit.

#### 3.2.4. MTB and DTB external trigger unit

This unit incorporates two identical input circuits used external MTB and DTB triggering. Their output signals are routed to the SIGNAL UNIT stage for MTB and DTB triggering.

Each trigger input circuit operates in the same way as the channel A and B attenuators. However, there are fewer attenuation coefficients for the external trigger inputs.

The different modes of this unit are controlled by the central microcomputer via a CONTROL CIRCUIT located on the ADAPTATION UNIT.

#### 3.2.5. Signal unit

This unit incorporates the pre-amplifiers for the vertical A and B channels and the trigger circuits for the MTB and DTB. All these functions are controlled by the central microcomputer via the CONTROL CIRCUIT FOR THE SIGNAL UNIT block.

##### Vertical channels A and B

Since both channels are identical, only channel A is described. The signal from the attenuator unit is applied to the CHANNEL A PRE-AMPLIFIER block. This block has a variable gain, influenced by the front-panel VAR potentiometer. The gain is also controllable in steps to give different input sensitivities of the instrument. CHANNEL A PRE-AMPLIFIER has two outputs.

- One output applied to the CHANNEL A TRIGGER PICK-OFF to trigger MTB and/or DTB via channel A.
- The other output signal routed to the DELAY LINE DRIVER. The channel B and the TRIGGER VIEW channel are also added in this block. The TRIGGER VIEW channel enables display of the MTB trigger source. The TRIGGER VIEW signal is switched in the DELAY LINE DRIVER.

To control the vertical position, either the CHANNEL A POSITION CONTROL block or the CHANNEL B POSITION CONTROL block influences the shift of the DELAY LINE DRIVER signal. This depends on the vertical channel displayed. The DELAY LINE DRIVER also incorporates a bandwidth limiter - a low-pass filter with a cut-off frequency of 20 MHz.

### MTB trigger circuit

The MTB HF TRIGGER PATH block receives a trigger signal from one of the vertical channels A or B, or from the MTB external trigger input. One of these signals can be selected for MTB triggering. The HF component in the selected signal is routed to the output of the block provided that HF reject is not on. The LF and DC components are routed through the MTB LF+DC TRIGGER PATH block. Depending on the selected filter mode, the signal is passed through (HF-REject, AC and DC mode) or it is blocked (LF-REject mode).

The output signal from the MTB HF TRIGGER PATH includes the output signal from the MTB LF+DC TRIGGER PATH and is routed to the input of the MTB TRIGGER AMPLIFIER. This block includes the LEVEL MTB and SLOPE functions. A d.c. voltage from the frontpanel LEVEL MTB control is routed via the AUTO LEVEL CONTROL block to the MTB TRIGGER AMPLIFIER. This d.c. voltage determines the instant that a trigger pulse appears on the output. The trigger pulse starts the time-base via the TRIGGER INPUT block. In the AUTO mode of the MTB, the AUTO LEVEL CONTROL ensures that the range of the MTB LEVEL control always lies within the peak-to-peak value of the signal on the c.r.t. screen. Apart from the MTB trigger pulse output, the MTB TRIGGER AMPLIFIER has two other outputs:

- One carries the TRIGGER VIEW signal applied to the DELAY LINE DRIVER,
- the other input sends a signal to the input switches of the FINAL X AMPLIFIER in order to enable X deflection by a signal from the MTB triggering.

### DTB trigger circuit

Basically, this circuit is identical to the MTB trigger circuit. This also has filters (HF TRIGGER PATH, LF+DC TRIGGER PATH) and a DTB TRIGGER AMPLIFIER. However, this amplifier has only one output, which carries the trigger pulse to start the DTB. There is no auto level control, but a Y OUTPUT AMPLIFIER block provides a path to make the DTB trigger signal available at a BNC output socket at the rear of the oscilloscope.

### 3.2.6. Delay line and final Y-amplifier

The vertical deflection signal from the DELAY LINE DRIVER on the SIGNAL UNIT is applied to the DELAY LINE. This block consists of a long coaxial cable that gives sufficient signal delay to compensate for propagation delay in the trigger circuits. As a result, the leading edge of a fast signal at which triggering occurs is clearly visible on the screen. The output signal from the DELAY LINE is applied to the FINAL Y AMPLIFIER unit. This unit consists of two blocks:

- the FINAL Y AMPLIFIER for driving the vertical deflection system of the c.r.t.
- the TRACE SEPARATION AND TEXT CONTROL, which functions as an input switch for the final amplifier. Depending on the selected display mode the following occurs:

MTB or DTB only: the output signal from the DELAY LINE is directly connected to the input of the FINAL Y AMPLIFIER.

Alternate time base mode: when selected, the displayed signal must be shifted upwards to display the MTB, and downwards to display DTB. The shift distance is adjustable with the front-panel TRACE SEP potentiometer. A signal from the TRACE SEPARATION AND INTENSITY CONTROL block indicates whether the instrument is in the ALT TB mode or not. The CONTROL CIRCUIT FOR SIGNAL UNIT delivers a signal to indicate if MTB (upwards shift) or DTB (downwards shift) is displayed. Text display mode: in which the signal from the DELAY LINE is not used as an input signal for the final Y amplifier. Instead, a deflection signal is applied from the text display part of the X/Z amplifier (discussed later). The selection between the two input signals is made by the NORMAL/TEXT signal from the CRT TEXT UNIT.

### 3.2.7. Time base unit

This unit incorporates the main time-base (MTB), the delayed time base unit (DTB) and the input selection switches for the FINAL X AMPLIFIER. All functions are controlled by the central microprocessor via the block CONTROL CIRCUIT FOR THE TIME-BASE. Certain supply voltages that require high degree of accuracy are stabilised by the ADDITIONAL SUPPLY VOLTAGE STABILISATION.

#### Main time base

The MTB may be started by a trigger pulse applied to the MTB FLIP-FLOP via the TRIGGER INPUT. If the MTB FLIP-FLOP switches over, the current from the MTB CURRENT SOURCE starts to charge a timing capacitor. The sweep time depends on the capacitive value; different selected capacitors are switched into the MTB by the CONTROL CIRCUIT. Thus, a linear sawtooth is generated across the timing capacitor, which can be used for X-deflection. The end of the sawtooth is detected by the TIME BASE END-OF-SWEEP FLIPFLOP, which then activates the HOLD-OFF CIRCUIT. This circuit switches the MTB FLIP-FLOP back so that the MTB sweep is stopped. The HOLD-OFF CIRCUIT keeps the MTB FLIP-FLOP in this position for the selected hold-off time during which further trigger pulses have no effect. The hold-off time is determined by the CONTROL CIRCUIT. The TRIGGER PULSE DETECTION block enables a two-way communication with the central microprocessor as follows:

- it signals to the microprocessor when a trigger pulse occurs,
- it receives a signal from the microprocessor to instruct the MTB whether or not to work in the AUTO (free-run) mode.

The MTB GATE AND ALT PULSE CIRCUIT block converts a signal from the MTB into the MTB GATE OUT pulse (high during MTB sweep); it also provides an ALternate pulse for display switching to the CONTROL CIRCUIT FOR THE SIGNAL UNIT.

#### Delayed time-base

The DTB FLIP-FLOP, DELAYED TIME-BASE, DTB CURRENT SOURCE and DTB GATE blocks function in the same way as their counterparts for the MTB. However, some of the DTB functional blocks are simpler. Of special interest is the way in which the DTB is started. The COMPERATOR block plays an important role in this. The block compares the MTB sawtooth signal with a d.c. voltage from the CENTRAL PROCESSOR UNIT. If the instantaneous sawtooth voltage exceeds the d.c. voltage, a signal is sent to the DTB FLIP-FLOP. This flipflop either starts the DTB immediately (in STARTS DTB mode) or starts it after the receipt of a trigger pulse from the TRIGGER INPUT (in TRIG DTB mode).

In the COMPARATOR, two different d.c. voltages may be selected:

- one for DTB start after the adjusted DELAY TIME
- the other for DTB start after DELAY + delta t.

The selection between these two d.c. voltages is achieved by a control signal from the CONTROL CIRCUIT FOR THE SIGNAL UNIT.

#### Horizontal display mode switching

In this part of the time-base unit the input signal for the FINAL X AMPLIFIER is selected. The MTB/DTB/X-DEFL SWITCH AND TB MAGNIFIER block enables selection between the MTB sawtooth, DTB sawtooth or the X-deflection signal from the MTB TRIGGER AMPLIFIER. The amplification of this block is increased by a factor of ten if the TB MAGN function is selected. The X POSITION shift is also generated in this block. All functions are controlled by the CONTROL CIRCUIT FOR THE TIME BASE. The output signal is applied to a second input switch for the FINAL X AMPLIFIER. This switch is called the HORIZONTAL DISPLAY CONTROL. This block connects the sawtooth input of the FINAL X AMPLIFIER to either the MTB sweep, DTB sweep or X-deflection signal (during normal signal display), or to a deflection signal from the text display part of the final X/Z amplifier unit (discussed later). This selection is made by the NORMAL/TEXT signal from the CRT TEXT UNIT.

#### 3.2.8. Text part of the X/Z amplifier

This part of the circuit is responsible for the vertical and horizontal deflection during the cycle in which text or cursors are displayed. The output of the Y DEFLECTION SELECTOR AND BUFFER STAGE block produces the deflection voltage for the Y-deflection. The output of the X DEFLECTION SELECTOR AND BUFFER STAGE block produces the X-deflection voltage. Each selector has five inputs; the selected input to be connected to the output is determined by the address code coming from the CRT TEXT UNIT. Both selectors receive the same address code and select identical positions. The five possible switch positions are:

- Position 1: the mode during which text is written on the c.r.t. screen. The Y-deflection is derived from the Y-SWEEP GENERATOR which produces a relatively slow sawtooth (started by the CRT TEXT UNIT). During the sawtooth, the whole screen can be written. The X-deflection is derived from the X-SWEEP GENERATOR which produces a number of fast sawtooth signals (started by the CRT TEXT UNIT). During one sawtooth, one horizontal line is written.

- Position 2 and 3: the mode in which a pair of vertical (time) cursor lines is written on the screen. In position 2, one X-sweep is generated and applied to the Y-deflection. The X-deflection receives a fixed d.c. voltage (DC1).

In Position 3, another X-sweep is generated and again applied to the Y-voltage. The X-deflection receives a fixed d.c. voltage (DC2). Since DC1 and DC2 are different voltages, a complete cycle results in two vertical lines being written on the screen. The horizontal distance between the lines depends on the voltage difference between DC1 and DC2.

- Position 4 and 5: the positions in which a pair of horizontal (volt) cursor lines is written on the screen.

In position 4, one X-sweep is generated and applied to the X-deflection. The Y-deflection receives a fixed d.c. voltage (DC1). In position 5, another X sweep is generated and again applied to the X-deflection. The Y deflection receives a fixed d.c. voltage (DC2). Since DC1 and DC2 are different voltages, the complete cycle results in two horizontal lines being written on the screen. The vertical distance between the lines depends on the voltage difference between DC1 and DC2.

### 3.2.9. Intensity and focusing part of X/Z amplifier

This part of the block diagram determines the intensity and focusing of the spot on the c.r.t. screen. The intensity is controlled by electrode G1 of the c.r.t. Electrode G3 controls the focusing. Since focusing and intensity are inter-related, the focusing of the spot has to be independent of the intensity.

Intensity (and focusing) can be determined either by the text generator part or during the normal signal display by the display mode logic. The selection between the two is made by the NORMAL/TEXT SWITCH block with the NORMAL/TEXT signal from the CRT TEXT UNIT.

In the text display mode, the intensity (Z) signal is derived from the CRT TEXT UNIT. This signal is applied to the TEXT INTENSITY PREAMPLIFIER. The intensity can be manually adjusted via the READ-OUT INTENSITY potentiometer.

In the signal display mode, the intensity signal is derived from the INTENSITY PRE-AMPLIFIER. This block receives the following intensity determining input signal:

- a display blanking signal during switch-over from one vertical channel to another in the CHOP display mode. This signal originates from the CONTROL CIRCUIT FOR THE SIGNAL UNIT.
- a signal from the Z-LOGIC on the TIME-BASE unit. This signal gives a blanked display during the hold-off period of the MTB and flyback of the trace. The display intensity-changes in the MTB intensified mode are also determined by this signal.
- an external signal applied to the Z-MOD input socket for determining the intensity.

The output signal from the NORMAL/TEXT SWITCH is split between the FOCUS AMPLIFIER and the INTENSITY AMPLIFIER. The outputs of both amplifiers are connected to the G3 and G1 electrodes of the c.r.t. Since these electrodes are at a high negative potential, the amplifier outputs are connected via high-voltage blocking capacitors to the c.r.t. These allow only the high-frequency components of the signal to pass and block the low-frequency (LF) and direct-current (DC) components. For this reason, the LF and DC components from the INTENSITY AMPLIFIER output are filtered out and applied to a MODULATOR. This superimposes the LF and DC components on to a high-frequency carrier wave to allow them to be passed via a high-voltage blocking capacitor. Following the capacitor (at -2,2 kV level), the signal is demodulated by an INTENSITY DEMODULATOR and a FOCUS DEMODULATOR.

The output signals from the demodulators (LF+DC components) are re-combined with the HF components received via the blocking capacitors to give the original signals. The Z signal is applied to G1 of the c.r.t. and the focus signal to G3. The focus signal for the c.r.t. spot is also influenced manually via the FOCUS CONTROL CIRCUIT.

### 3.2.10. Power supplies.

Primary converter.

The mains input voltage is filtered and then applied to two identical blocks, namely, PRIMARY CONVERTER MAINS VOLTAGE TO 24 VDC. Two units are switched in parallel in order to obtain the required output power. The two output voltages, each 24 VDC, are connected in series to give 48 VDC for the SECONDARY CONVERTER UNIT. The primary converters cover all common mains voltage ranges and offer the necessary separation required between the mains voltage and the oscilloscope circuits.

### Secondary converter

On this unit, the FLYBACK CONVERTER generates the necessary supply voltages for the oscilloscope circuits. These low-voltage supplies are stabilised by a CONTROL CIRCUIT to the converter. The unit also incorporates the LINE TRIGGER CIRCUIT. This block receives an input signal from the MAINS FILTER and converts this into a 50/60 Hz sinewave of constant amplitude by comparing it with a reference voltage. This signal is used for MTB LINE triggering. The CONTROL CIRCUIT block also generates an alarm signal for the CENTRAL PROCESSOR UNIT to safeguard data in the event of mains switch-off or failure, when back-up batteries are fitted. The FAN CONTROL CIRCUIT monitors the temperature inside the instrument by means of a sensor on the MOTHER BOARD. If necessary the FAN speed is automatically adapted, depending on the measured temperature.

### High voltage converter

This unit generates the +14,3 kV for the post-accelerator anode of the c.r.t. and the -2,2 kilovolt for the cathode circuits. The supply voltage from the secondary converter unit is applied to a FLYBACK CONVERTER with a CONTROL CIRCUIT for output voltage stabilisation. The SUPPLY VOLTAGE SENSOR prevents the FLYBACK CONVERTER from starting in the case where the supply voltage is too low. The output a.c. voltage from the converter is rectified to give -2,2 kV and a rectified output is multiplied to give +14,3 kV.

## 3.2.11 Auxiliary circuits on mother board

### Trace rotation

This block determines the strength and sense of the current passed to the trace rotation coil around the neck of the c.r.t. The trace rotation circuit is adjustable by a front-panel screwdriver-operated TRACE ROT control.

### Illumination circuit

This block determines the amount of current passed to the graticule illumination lamps of the c.r.t., controlled by the ILLUM potentiometer on the front panel.

### Frequency divider and output amplifier

This block divides the 3 MHz clock frequency from the central microprocessor to a 5 KHz square-wave. This square-wave signal is amplified and stabilised to give a 0,8 V output on the CAL voltage output socket.

#### 4. CIRCUIT DESCRIPTION OF LCD UNIT (see fig. 4.2.)

The LCD unit incorporates five liquid-crystal displays, each fed from its own driver IC (D101 - D106). The 4 V supply voltage for the driver ICs (pin 2) is derived from the +13,8 V supply input on X101 pin 6 via transistor V101 and its associated circuit. Since the base-emitter voltage of V101 is influenced by the ambient temperature, so is the 4 V supply voltage. The voltage variation is from 4.5 V to 3.5 V over a temperature range between 0 and 80 degrees. This serves to compensate for LCD intensity changes due to variations in ambient temperature.

Each driver controls a maximum of 64 segments of the LCD in two groups of 32 segments; i.e. 32 segment outputs + 2 groupselection outputs. Either group 1 of 32 segments (backplane 1) or group 2 or 32 segments (backplane 2) is activated at a time. Each of the 32 outputs (S1 - S32) is connected to two segments in the LCD, one segment opposite backplane 1 and the other opposite backplane 2.

When information is applied to the driver outputs, with BP1 active, it is routed to activate the chosen segments opposite backplane 1; then a moment later, when BP2 is active, information is generated to activate the chosen segments opposite backplane 2, and so on.

The switching between BP1 and BP2 occurs at a frequency of about 2500 Hz derived from the oscillator section of D106 (pins 2, 3 and 4). This frequency is determined by the external RC combination R113/C101. The other drivers D101 - D104 share this 2500 Hz signal (pins 37 and 38 paralleled), therefore their oscillator sections are not used (pins 3 and 4 are earthed).

Each LCD driver has three inputs driven from the central microcomputer:

- LCD (pin 40), a data latch enable input used to select the correct driver from D101 - D106. If pin 40 is at logic high, the LCD is selected to accept data. Conversely, a logic low inhibits data.
- SERCLK (pin 1) is the clock input.
- DATA1 (pin 39) is the signal information input. The clock input receives a row of 35 pulses (see Fig.4.3). In parallel with these clock pulses, a row of 34 data-bits is applied to the DATA input. The data is valid at the negative-going edge of each clock pulse. The row of data-bits starts with a zero start bit. Then the following 32 data-bits determine which of the 32 segments of a row must be activated (data-bit high) and which must remain inactive (data-bit low). The last data-bit determines for which backplane the data is intended, LCD backplane 1 (data-bit high) or LCD backplane 2 (data-bit low). This 35th clock pulse ends the information loading cycle.

The clock signals are common to all drivers, as also the DATA 1 signals. The correct LCD driver is selected to receive the applied data pulses by a high logic level on the LCD input, pin 40.

The interconnection and level adaptation between the 5 V TTL microcomputer signals and the LCD drivers that operate on a 4 V supply is achieved by the high-ohmic resistors R101 - R108.

## 5. CIRCUIT DESCRIPTION OF SWITCH UNIT (See fig. 5.3.)

The switch panel unit incorporates the following main functions:

- the front-panel pushbutton switches grouped in a matrix configuration.
- the front-panel LEDs located in the pushbutton switches and the associated LED drivers.
- the step controls for vertical sensitivity and time-base setting and the DELAY or delta t continuous control.

These main functions are now discussed in more detail.

### Pushbutton switches

These switches are located on the crossing points of an 8 x 8 wire matrix: eight horizontal rows 0 to 7 and eight vertical columns 0 to 7. The rows and columns are connected to the CPU unit, which scans the switch positions (see CPU unit circuit description).

### The control circuitry for the LED's. output signals and LED drivers

The LEDs in the pushbuttons are divided into two groups of 32 and driven by the LED driver ICs N501, N502, each with 16 output pins. Each output is derived from an open-collector NPN transistor and drives two LEDs. The anode of one LED of a pair can be switched via transistor V504 to the +5 V supply, the anode of the other LED is switched by transistor V507. Transistors V504 and V507 are switched on and off alternately; i.e. when one is on, the other is off.

This alternate switching for the diode groups is controlled by the 800 Hz square-wave oscillator formed by D503/1,2,3 and R501/C501. The 800 Hz square-wave is routed via diode V502, network R502/C503, inverter D503/12,13,11, and transistor V503 to V504. The 800 Hz square-wave is also routed via diode V501, and an identical circuit, to transistor V507.

The RC networks R502/C503, R503/C502 give a time delay, which ensures that the switching transistors V504 and V507 are not conductive at the same time.

In addition, the 800 Hz square-wave is routed to two LED drivers N501, N502 on input pins 7. Depending on the logic level applied to pin 7, the sixteen outputs of a LED driver generate the correct control signals for the sixteen LEDs connected to switching transistor V504, or they generate the correct control signals for the sixteen LEDs connected to switching transistor V507. Both LED driver ICs incorporate two registers, each of 16 bits. A register contains the control information for a group of sixteen LEDs. If control pin 7 is at logic low, the contents of the first register are applied to the outputs of the LED driver. If pin 7 is high, the contents of the second register are applied to the outputs.

Input signal for the LED drivers.

Similar to the LCD drivers, the LED drivers also have three input pins:

- input pin 5, used to select either driver N501 or N502 (LED 0 or 1). A logic high enables the driver to accept data.
- input 9, the clock (SERCLK) input.
- input pin 8 is the data input. The clock input receives a row of pulses as shown in Fig. 5.1. In parallel with the clock pulses, a row of data-bits is applied to the data input. The first bit is a logic low start signal; the following 16 bits are loaded into one of the two registers, depending on the 18th data bit (low for the first register, high for the second).

The clock input is common to the two LED drivers, N501, N502. Likewise the data input on pins 8 is common, selection of the appropriate driver being made by a logic high input signal on pin 5 of either N501 or N502.

The rotary switches for vertical sensitivity, MTB, DTB and delay-time. These controls are optical switches formed by LEDs and photo-transistors. Each switch consists of a perforated disc through which the light from two infra-red LEDs falls on two photo-sensitive transistors. If the switch is operated, the movement is detected by the photo-transistors. The dual LEDs and photo-transistors also detect whether the switch movement is clockwise or anticlockwise (see intermediate unit circuit description). The infra-red LEDs are located on the rear of the switch unit. LEDs H501...H506 are supplied with a d.c. current from the +13 V rail via R 514. LEDs H507...H512 are similarly supplied via R516. The perforated discs and their encapsulation are also mounted on the switch print unit.

# 6. CIRCUIT DESCRIPTION OF THE INTERMEDIATE UNIT (see fig.6.3)

This unit incorporates the following control elements:

- potentiometers R1 - R11 and their switching logic
- photo-sensitive transistors for the optical switches, their switching and detection logic.

## The potentiometers

All potentiometers are paralleled between earth and the +10 V line, stabilised by the voltage stabiliser N1111. A built-in reference voltage of 7.5 V on pin 6 is applied to the non-inverting input (pin 5) of a comparator. The inverting input (pin 4) is connected to potentiometer R1164 of a voltage divider to compare the reference voltage with a part of the output. Any difference is corrected by N1111. The output voltage is available on pin 10, the output flowing through the current sensing resistor R1162. The voltage across R1162 is measured on pins 2 and 3 of N1111. If this voltage exceeds 0.7 V, the output voltage on pin 10 cuts off.

The eleven potentiometers can be divided into three groups:

- potentiometers that have no connection with the circuits on the intermediate unit: the slider voltage is directly routed to its associated analog circuit via connector X1102; namely R10 (HOLD OFF), R9 (TRACE SEP), R4 (X POS) and R3 (LEVEL DTB).
- potentiometers connected with circuits on the unit and also directly routed to associated analog circuits via connector X1102; namely, R6 (VAR A), R7 (VAR B), R8 (VAR DTB) and R11 (VAR MTB). On the intermediate board, it is necessary to detect whether or not these potentiometers are in the CAL position. Therefore, each is resistor-connected to a separate input on IC D1102. The function of this IC is explained later.
- potentiometers that can only connect with their analog circuits via the intermediate unit circuits; namely, R1 (A POS), R2 (B POS) and R5 (LEVEL MTB). The analog circuits normally connected to the sliders of these potentiometers are disconnected in the AUTO SET mode by IC D1101 and connected to fixed d.c.voltages. Multiplexer D1101 has three two-position switches. Depending on an address code on pins 9, 10 and 11, the three switches can select the required position. The switch interconnections with the AUTO SET mode on and off are as follows:

OUTPUTS			
AUTO SET	PIN 14	PIN 15	PIN 4
OFF	TO PIN 13 (Slider R1)	TO PIN 1 (Slider R2)	TO PIN 3 (Slider R3)
ON	TO PIN 12 (+5 V supply)	TO PIN 2 (+5 V supply)	TO PIN 5 (+3.85 V from R1123/R1124)

The address code for the multiplexer is generated by an addressable latch D1103, which receives the following control signals from the microcomputer:

- the address that determines the output to be changed is applied to pins 1, 2 and 3.
- pin 13 receives a low or high level that is transferred to the selected output.
- a low level on pin 14 enables D1103 to accept data.

#### Position detection for potentiometers

The potentiometer sliders of R1, R2, R5, R6, R7, R8 and R11 are connected via resistors to inputs of the analog multiplexer D1102, a 16-position switch. Depending on the 4-bit address applied to pins 10, 11, 13, 14, one of the sixteen inputs is connected to the output (pin 1). In this situation, only seven inputs (pins 3 - 9) of D1102 are used.

By changing the address of the multiplexer, all slider voltages are available in sequence on pin 1 of D1102. These slider voltages are thus applied to a double comparator circuit with the operational amplifiers N1104/5,6,7, and N1104/2,3,1.

N1104/5,6,7: the -ve input is connected to +5 V. This comparator operates via the + input if R1, R2 or R5 are moved through their mid-position. If the slider voltage from R1, R2 or R5 rises above +5 V, the output of this comparator rises from 0 to +13 V. This output signal is routed via D1106 pins 7 and 3 to the microcomputer. D1106 is described together with the optical switches.

N1104/3,2,1: The -ve input is connected to a d.c. voltage of +0.38 V. This comparator operates via the + input whether or not R6, R7, R8 and R11 are in their CAL position. If the slider voltage of R6, R7, R8 or R11 rises above +0.38 V, the output of the comparator rises from 0 to +13 V. This output signal is routed via D1108 pins 7 and 3 to the microcomputer. D1108 is described together with the optical switches.

#### Position detection for optical switches

The rotation of the A channel Y AMPL switch is detected by the photo-transistors H1104 and H1111. If the control is turned from one position to another, light from the infra-red LEDs falls in H1104 and H1111, pulsed via the holes in the perforated disc. As a result, the photo-transistors conduct for some time and their collectors are low (see Fig. 6.1)

The collectors of H1101, H1102, H1103 and H1104 are connected to multiplexer D1106. The collector of H1106 is connected via an inverter D1107/5,6, to D1106. In addition, the output of the operational amplifier N1104/7 is connected to D1106. The multiplexer D1106 is an 8-position switch. When an address is applied to pins 9,10 and 11, output pin 3 is connected with one of the inputs.

If one of the collectors of H1101 - H1104 becomes low, transistor V1113 conducts, giving a high logic level via inverter D1107/1,2, and gate D1109/11,12,13 to the restart (RST 6,5) of the microprocessor. This restart pulse immediately causes the microprocessor to generate different addresses for the multiplexer; as a result, all the inputs are scanned for a while. If the input is reached that is connected with the photo-transistor of the operated switch, the multiplexer stays stable; i.e. it remains connected to the switch while it is being operated. The number of steps made by the switch results in an identical number of pulses at the collector of its photo-transistor. These pulses are routed to the microprocessor via D1106 and inverter D1107.

Figure 6.1. shows that every optical switch has two photo-transistors in order to detect the direction of switch-rotation. The first photo-transistor is connected to multiplexer D1106 as described. The second photo-transistor is connected to an identical second multiplexer D1108. The photo-transistors H1104 and H1111 are used for Y AMPL channel A; H1101 and H1107 are used for Y AMPL channel B; H1103 and H1109 are used for DEL'D TB; H1106 and H1112 are used for DELAY or delta t; H1102 and H1108 are used for MAIN TB.

The circuit comprising gates D1109/1,2,3, D1109/4,5,6, D1109/8,9,10, and the associated components, detect if the control DELAY or delta  $t$  is operated. As this control has no mechanical stop, it may be that photo-transistor H1112 is permanently conducting in its rest position. However, this does not result in a RST 6,5 pulse to the microprocessor via gate D1109/11,12,13. This blocking effect is achieved by capacitors C1117 and C1118, which ensure that only changes in the state of the collector of H1112 are routed to RST 6,5 of the microprocessor.

CIRCUIT DESCRIPTION OF CENTRAL PROCESSOR UNIT AND HEF 4094 BUS.

The central processor unit (CPU) provides microprocessor control of the oscilloscope functions and is given on three diagrams: fig 7.3. (CPU1), fig. 7.4. (CPU2) and fig. 7.5. (CPU3).

## 7.1. CIRCUIT DESCRIPTION OF CPU DIAGRAM 1.

This diagram basically consists of IC D1601, a 8085 uP (microprocessor) decoder circuits for various related read-write functions, decoding latches for the address and data buses, and the watchdog circuit.

## Clock signals

The 6 MHz crystal-controlled clock, on D1601 pins 1 and 2, provides the time reference for all micro-computer actions. It is internally divided to give a 3 MHz square-wave output (CLK) on pin 37. The 3 MHz CLK signal is fed to a divide-by-4096 circuit D1646 to give a 732 Hz restart signal (RST7,5) to microprocessor D1601 on pin 7. This low frequency restart signal is used to initiate various program operations. The 3 MHz CLK signal is also routed via inverter D1621-6 to provide an external clock signal EXCLK- to synchronise the interface bus IEEE control. Via inverter D1622-12, the 3 MHz CLK signal also provides a CALCLK signal for the calibrator on the mother board.

## Address outputs

The sixteen address outputs from D1601 are divided into two groups. Addresses A0 to A7 are decoded from eight address/data bidirectional lines AD0 to AD7 by decoding latch D1603, controlled by the address latch enable signal ALE; addresses A8 to A15 are routed directly to the address bus. The address outputs on the bus are buffered in D1618 and D1619 to provide an external address bus, EXA0 to EXA15, via connector X1603 for the CRT TEXT UNIT and the IEEE unit.

## Data I/O lines

The eight bidirectional read/write databus lines D0 to D7 are decoded from the eight address/data lines AD0 to AD7 by decoding latch D1602, controlled by the RD- (read) signal and the ENCPU- (enable CPU) signal. Similarly, the decoding latch D1617 decodes the eight bidirectional external databus lines EXD0 to EXD7 for the CRT TEXT UNIT and IEEE unit controlled by the RD- and ENCPU- signals.

## Commands for CRT TEXT and IEEE communication

In address decoder D1613, two address lines A14, A15 are decoded, enable by the IO/M signal from the uP, to give four output combinations:

- The ENCPU- signal is coming from NAND gate D1621-3; inverter D1622-10 provides the ENCPU signal. If ENCPU- is low, the combined address/databits 0...7 carry data for the databus of the CPU. This data goes via latch D1602. If ENCPU is low, the address/data bits 0....7 is applied to the external databus for CTU/IEEE communication via latch D1617.
- CEROM-, a chip enable signal for the programm memory on CPU2.
- Enable signal applied to D1613/15 for decoding address lines A11, A12 to give a further four output combinations from D1613.
- Two chip select signals ENRAM0- and ENRAM1- for the random-access memories on CPU2.
- An enable signal from pin 10 for two 3-8 decoders D1614 (pin 5) D1616 (pin 5) producing read-write control signals for uP-related functions.

Read decoder D1614 reads the input switches and probe indicators using the three address input lines A0, A1 and A2, also enabled by the read RD signal. One out of the six outputs in use is activated at a time. These are:

- RDROW- for reading row of input switches
- RDCOL- for reading column of input switches
- RDPRO- for detecting the probe 0 type
- RDPRI- for detecting the probe 1 type (not used in this instrument)
- RMEM0- for enabling latch D1609 which reads data into the data bus lines D0...D7
- RMEM1- for enabling latch D1612 which reads data into the data bus lines D0. .D3

Latch D1609/1 takes in the kA and kV information from the impulse switches on the INTERMEDIATE UNIT via connector X1601 and also the COMP signal from the IEEE-unit which scans the position of all the potentiometers.

Latch D1609/19 takes in the input protection signals INPROTA and INPROTB from the ATTENUATOR UNIT, which are active if the 50-ohm input exceeds 5 V.

Latch D1612/19 receives the READY- handshake signal from the CRT TEXT UNIT to confirm a block of data has been taken in; the TBSI input signal from the TIME-BASE confirms that a trigger pulse occurs during the sweep. In AUTO SET mode this information is used to read just the time base setting. In the other time base modes the information inhibits the free run of the time base.

Latch D1612/2 is a buffer for communicating with the CRT TEXT UNIT and IEEE. The external commands are EXRD-, EXWR-, EXIO/M-, EXRES. The TXTINT signal from the TEXT INTENSITY POTENTIOMETER routed via the CPU unit to the CRT TEXT UNIT. It determines the READ OUT potentiometer position. In the OFF position it gives a no interrupt signal to the text generator indicating that no display time is needed for text

Write decoder D1616 is also addressed by input lines A0, A1 and A2, and enabled by the write WR- signal. One of the five outputs is activated at a time. These are:

- WMEM0-, a chip enable signal for the addressable latch D1608.
- WMEM1-, an enable signal for the LCD/LED latch on CPU3.
- WMEM2-, an enable signal for the switch/potentiometer latch on CPU3.
- WRLDAC-, an enable signal for the least-significant byte DAC on CPU2.
- WRMDAC-, an enable signal for the most-significant byte DAC on CPU2.

The bit addressable latch D1608 is addressed by input lines A3, A4 and A5, and enabled by WMEM0- as stated. When addressed, data signal D0 is put into one of eight memory cells to give the following outputs:

- SCL, a serial clock for the internal HEF-bus.
- POTSTR-, a strobe signal for digitising potentiometer positions on the INTERMEDIATE UNIT. This happens via D1647/5,6 on CPU3.
- S/H0, S/H1, sample and hold control for DACs on CPU 2.
- TRIGRES-, for resetting a flip-flop on the TIME-BASE.
- TBS0-, this signal is made low and applied to the time base unit in order to be able to detect a trigger pulse during the sweep (see also time base output signal TBSI)
- WDOG-, main program loop trigger signal to watchdog circuit.

#### The watchdog and power down circuit

This circuit ensures that the system program is switched off under fault conditions and that memory contents are saved. If the system is operating correctly, pulses from the main program loop are received from D1608-11 via diode V1603 to give a low input on pin 10 of the watchdog trigger circuit D1621 (NAND gate with a feedback loop). The output on pin 8 is therefore high and consequently input 9 is high. The logic high on pin 8 blocks diode V1604.

With the power supply operating correctly, the AL- (alarm) signal via S1602 is high and is passed via R1607 to keep the reset signal RES IN- high (capacitor C1603 charged) for normal on or reset.

Transistor V1606 is conducting then in order to keep the TRAP input of the uP low.

This RES IN- signal becomes low under fault conditions:

- AL- is low if the power supply is out of specification and C1603 discharges to make RES IN- low.
  - Alternatively, if the main program loop is interrupted, absence of trigger pulses on D1621-10 gives a low on output 1621-8.
- Consequently, diode V1604 conducts and makes RES IN- low.

In such a fault condition, the logic low on the reset line is passed via base resistor R1609 to cut off transistor V1606. The 5 V collector supply then activates the TRAP input (D1601-6) of the uP. In this way, when the control switches off, the memory contents are saved. On restoration of power, the program is reset.

During a service routine, switch S1601 is closed and S1602 is open. The earth on S1601 keeps input D1621-10 low, consequently the output (8) is high, which blocks diode V1604 and prevents any interruption of the program. Likewise, with S1602 open, the +5 V supply via R1606 maintains the reset line high to give normal system operation during the service routine.

## 7.2. CIRCUIT DESCRIPTION OF CPU DIAGRAM 2.

This part of the circuit diagram basically consists of IC D1631 a 2 kbyte (RAM) random-access memory (for PM386A/PM3296A, a further 2 kbyte RAM, D1632), a program memory D1633, supply voltage control for the RAM, and digital-to-analog conversion for the delay voltages, with its reference voltage stabilisation circuit N1634.

#### Random-access memory

The 2 kbyte RAM D1631 is used as a "scratch-pad" register for the read/write data signals such as settings of switches, controls, etc. The bidirectional databus D0 to D7 is controlled by address lines A0 to A10, enabled by chip select input G3 and the RD-/WR- (Read, Write) inputs. Optionally, the RAM memory can be extended by an identical 2kbyte plug-in RAM, D1632.

#### Supply voltage control for RAM

The chip select signals from circuit diagram CPU 1 for the RAM memories are ENRAM0 and ENRAM1.

If ENRAM0 is active (high), transistor V1607 conducts and switches the chip select input D1631-18 low.

If ENRAM1 is active (high), transistor V1608 conducts and switches the chip select input D1632-18 low (if memory option fitted).

Transistors V1616, V1617 are normally switched off.

The rest of this circuit controls the switchover at supply failure to the internal batteries and prevents read/write of RAM contents at low supply voltages.

When the 5 V supply (+5D) is present, the current flowing through the zener reference diode V1612 switches on transistor V1614 (to hold off V1616, V1617) and V1613, which in turn switches on the series regulator V1611 to apply +5D to the VRAM output.

When the supply drops below 4 V (e.g. in power down condition), the current through the zener reference is insufficient to maintain V1613, V1614 conducting. As a result, V1611 also switches off, and if a battery is installed it provides the VRAM supply via diode V1609 which is now conductive.

With V1614 switched off, its collector voltage applies a logic high signal to the bases of V1616, V1617. These transistors conduct and inhibit the ENRAM0, ENRAM1 enable signals so that the RAMs cannot be read or written at low supply voltages.

#### Program memory

The program memory D1633 is a read-only memory (ROM) which has more capacity than the RAMs. It is addressed by lines A0 to A12 and controlled by the RD- and CEROM- signals from circuit diagram CPU 1. For this instrument application, a capacity of 128 kbyte is internally selected by switch S1603. The read-only data outputs are D0 to D7 and are applied to the databus.

#### Digital-to-analog conversion

Digital information from the databus is clocked into the buffers of D1636 by WRLDAC- (least-significant byte) and into the buffers of D1637 by WRMDAC- (most-significant byte).

Twelve different bits are used to give the full range of the analog output on pin 1 of the 12-bit DAC N1639.

The -VREF (-10 V) on N1639-17 is derived from a reference voltage stabiliser circuit, described later.

The current on output N1639-1, adjustable in steps, is applied to input pin 2 on operational amplifier N1644 which acts as a current-voltage converter. As these steps are coarse, the four least-significant bits of the digital inputs are used to feed in a small current that can be adjusted to bridge the steps. These four bits control four gates D1638, which provide current sources derived from the +5 V rail via resistors to pin 2 of operational amplifier N1641. The voltage output on N1641-6 produces a small current via R1646 which combines with the step current from the DAC.

The combined output current from N1644-6 is applied to two sample and hold gates N1642, N1643 (analog buffers), and as a DAC signal to the CRT TEXT UNIT for CURSOR control and to determine potentiometer positions on the IEEE unit. A DAC feedback signal is also applied to the N1639-18.

The analog buffers N1642, N1643 are used for holding the instantaneous values for starting the delayed time-bases.

The analog signal from the DAC is clocked into the sample and hold gate by S/H0 for N1642 to give the time-base DELAY voltage: output signal AN0:

The analog signal from the DAC is clocked into the sample and hold gate by S/H1 for N1643 to give the time-base DELAY +  $\Delta t$  voltage: output signal AN1.

#### Reference voltage stabilisation

The -10 V reference voltage (-VREF) for the DAC circuit is derived from the -13 V line applied via R1654 to N1634. Part of the output on N1634-9 is fed back via the slider of preset R1653 to the operational amplifier input 5 for comparison.

The stabilised -VREF reference voltage is routed from N1634-6 to the DAC reference input N1639-4.

### 7.3. CIRCUIT DESCRIPTION OF CPU DIAGRAM 3.

This part of circuit diagram basically consists of databus input circuits from switch position reader latches D1623, D1624, D1626, D1627, probe input detector D1628, and databus output circuits for LCD and LED output decoding, HEF-bus outputs and potentiometer strobe signals.

#### Switch position readers

The microprocessor scans the switch matrix regularly using the latch enable signals RDROW- to read rows and RDCOL- to read columns. Two strobes are necessary to read the matrix: a row strobe and a column strobe to determine the row-column interconnections made by operated switches.

With no switches depressed, the rows and columns are logic high through pull-up resistors. However, during the row strobe, the columns are latched to earth and an operated switch connects an earth to its particular row.

Similarly, during the column strobe, the rows are latched to earth and the operated switch connects an earth to its particular column. The combined row and column digital signals sent to the databus give the "grid reference" of the particular switches that are operated. The circuit details are now given.

When RDROW- is active, latch D1623 applies earthens to all the columns; the column pull-up resistors are provided by resistor array R1614. Latches not activated D1626 read the rows: logic high if all switches in a column are not activated, logic low if any switches in a column are operated.

When RDCOL- is active, latch D1627 applies earthens to all the rows; the row pull-up resistors are provided by resistor array R1616. Latches D1624 read the columns; logic high if all switches in a column are not activated, logic low if any switches in a column are operated.

#### Probe input detector

The sensitivity of a probe connected to the A and/or B input is detected by IC D1628, controlled by a read probe signal RDPRO from the uP. Two analog inputs are provided, one for the Y channel A signal input and one for the B signal input. A current source is used to sense the resistance (i.e. probe type) of a connected probe. Each probe (x1, x10, x100) has a different resistance value. The analog values received are digitised in D1628 and fed to the databus to control the oscilloscope sensitivity read-out in the LC-displays of channel A and B.

#### LCD and LED decoders

When the WMEM1 signal from CPU 1 is active, latch D1604 clocks the eight databus bits to two separate ICs.

Four input data lines to D1606 (a 4 in-16 out circuit) produce seven LCD and two LED drive outputs.

Three input data lines to D1647 (a TTL/CMOS level adaptor) produce the HEF-bus signals DATA, ENSCP and SERCLK.

The POTSTR- input from CPU 1 gives via D1647/5,6 the PSTRB- signal for the Intermediate unit.

#### Potentiometer/impulse switch strobe signals

When the WMEM2- signal from CPU 1 is active, latch D1607 clocks the databus bits to provide three strobe signals, SELDRO, SELDR1, SELDR2 for addressing the multiplexers that are scanning the impulse switches. After level adaptation in D1611 (TTL to CMOS), four strobe signals POT0, POT1, POT2, POT3 are clocked to determine the potentiometer positions on the INTERMEDIATE UNIT

#### 7.4. DESCRIPTION OF HEF 4094 BUS.

As stated, the three HEF-bus signals DATA, ENSCP and SERCLK are generated from the databus of the central microcomputer via level adaptor D1647. As seen Fig. 7.1., the DATA is applied serially to various printed-circuit boards of the oscilloscope via HEF4094 shift registers. Depending on the amount of functions that need to be controlled one or more HEF4094 shift registers are present per p.c.b. These shift registers are all connected in series and a very long shift register is build-up in this way. However, the serial clock signal SERCLK and the enable scope pulses ENSCP are applied in parallel to the various HEF IC's.

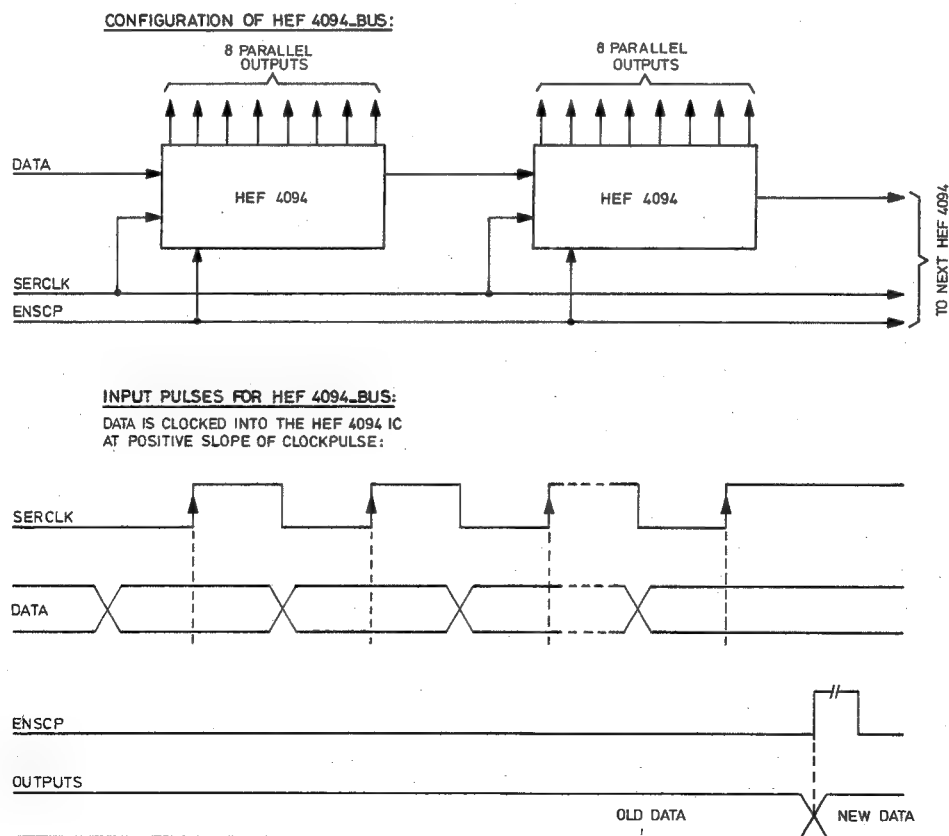

Data is valid on the leading edges of the SERCLK pulses when the ENSCP pulses are low.

A serial row of data bits from the central microcomputer is fed to the row of HEF4094 8-stage shift registers to switch the various functions on the p.c.b.'s. A data burst is fed in until all the shift registers are full and then it is transferred to the output buffers to activate the board functions.

Level adaptors are incorporated in the ADAPTATION UNIT to convert the 12 V CMOS levels to 5 V TTL and back.

Figure 7.1. shows the timing diagram of the HEF-bus. When the ENSCP signal is inhibited (high) data is transferred and the next low signal enables a burst of new data to be shifted in.

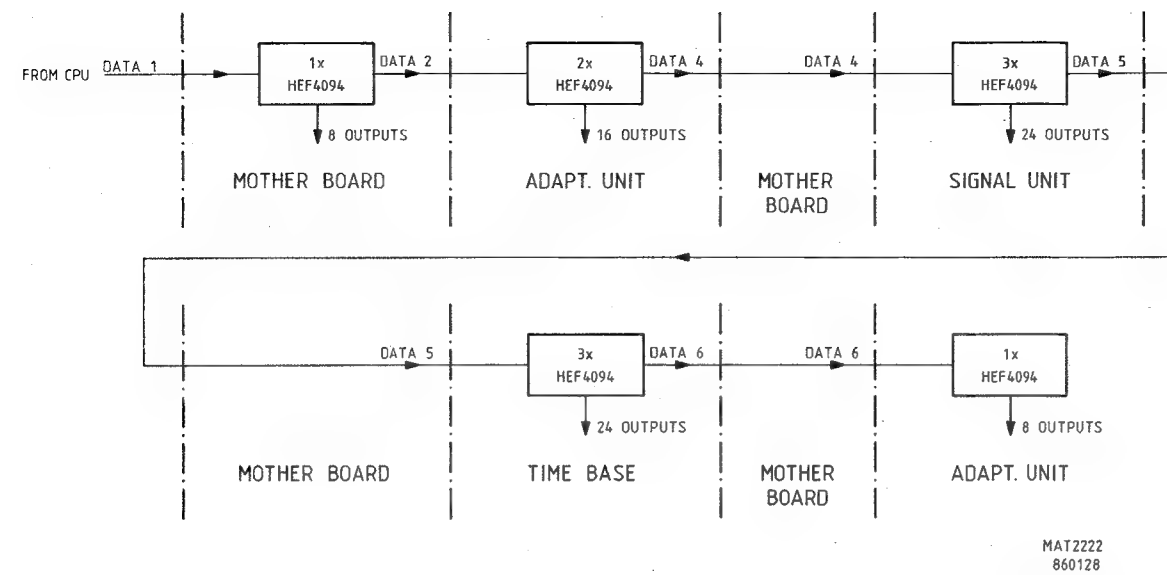

For the routing of the HEF-bus signals see fig. 7.2.

## 8. CIRCUIT DESCRIPTION OF CRT TEXT UNIT.

The CRT text unit provides separate microprocessor control of the alphanumeric text that appears on the screen read-out, the circuits being located on the circuit diagrams CRT text 1 and CRT text 2.

### 8.1. CIRCUIT DESCRIPTION OF DIAGRAM (See fig.8.2.)

This diagram basically consists of IC D8201, a 8085 microprocessor, identical to the central uP, an 8155 random-access memory, programmable input, output port/14 bit counter combination, D8202, a program memory (PROM) D8204, input data latches D8206, D8207, D8208, a latch write decoder circuit with D8213, D8214 and a latch read decoder circuit with D8212.

#### Text microprocessor

The text microprocessor D8201 is identical to the central microprocessor and operates as described for the CPU UNIT. The 16 address lines are also divided into two groups; address lines A0 to A7 are decoded from eight address/data bidirectional lines AD0 to AD7 by decoding latch D8203, controlled by ALE (address latch enable). The 6 MHz clock is internally divided to produce a 3 MHz signal (CLK1) on D8201-37. This is further divided in 7-bit counter D8209 to give a 23.4375 kHz TIME IN signal (CLK2) to RAM D8202.

Random access memory/input, output port/14 bit counter.

D8202 further divides the CLK2 input D8202-3 by two to give a TIME OUT 14-bit counter output on D8202-6, which is inverted by D8211/3 to form the RST6.5 signal.

The bidirectional address-databus enables CRT text information to be read and written into the RAM, controlled by RD- and WR- signals. The RAM is enabled by address lines A14, A15 via the NAND gate D8211-6.

D8202 produces the following signals:

- SEL0, SEL1, SEL2 for multiplexers on the X/Z AMPLIFIER. Only two text sentences are normally needed at a time, except for service mode or warnings where the full screen is written on.
- DSPL- to start text time-bases (on CRT text diagram 2).
- MULT-: this signal is applied to the reset input of flipflop D8221 on diagram 2. If the signal is low, the text unit works in multitrace mode: several X-sweeps (lines) are generated. This is necessary to write text. If the signal is high, only two X-sweeps are generated. These sweeps are used to write two cursor lines.
- BLANK: this signal is applied to one input of nand-gate D8228/8, 9, 10. If the signal is low the display is blanked. This happens during switching-over between text and signal display.
- SELPG: this "select page" signal is used to select two pages in the video-RAM D8237. This signal is normally high: as a result page 1 is selected. Page 0 (SELPG low) is normally not used.

The text intensity signal TXT INT from the CPU is routed to an input port of D8202 via transistor V8223 to give a TXT OFF signal when the TXT INT input is low.

#### Program memory

The erasable PROM D8204 is a program read-only memory served by address lines A0 to A1, and controlled by the RD- signal when the chip enable signal CEROM- is active.

The memory capacity is preset for 64 kbyte by switch S8201.

### Input data latches

Input data from the CPU central microprocessor is received on lines EXD0 to EXD7.

These input data lines provide the inputs to the three latches D8206, D8207, D8208.

Each 8-bit latch can be written into by the central uP under the control of its own write enable signal, WP0-, WP1-, or WP2-, generated by the latch write decoders D8213, D8214.

Each 8-bit latch can be read to the CRT TEXT UNIT under the control of its own read enable signal, RDCPU0-, RDCPU1- or RDCPU2-, generated by the latch read decoder D8212.

### Latch write decoder

The latch write decoder uses the CPU signals EXA14, EXA15, EX10/M, EXA11, EXA12, EXWR-, EXA0 and EXA1 to address the CRT TEXT UNIT.

These signals are applied to the D8213 and D8214 decoders in cascade to make one of three write signals active, WP0-, WP1- or WP2-, one for each latch.

When the last latch, D8208, is filled, WP2- goes high and gives a high input to NAND gates D8211 (wired as a set/reset flip-flop) to give a READY- signal to the input port of D8202, D8202-39, to say that data is ready to be taken in, and also to the central microprocessor on the CPU UNIT.

### Latch read decoders

The latch read decoder uses addresses generated by the text microprocessor to read the latches.

Addresses A14, A15 controlled by the IO/M signal provide inputs for D8212 to generate the chip enable signal CEROM- for the program memory input D8204-20. Output D8212-6 is fed to NOR gate D8216-2 where it is used together with the RD- input as an enable input D8212-15. It controls addresses A0, A1 to provide three read signals, RDCPU0-, RDCPU1- or RDCPU2-, one for each latch if the uP is ready (READY-) to receive the text.

When the last latch, D8202 is read, flip-flop D8211 is reset by RDCPU2-.

## 8.2. CIRCUIT DESCRIPTION OF DIAGRAM 2 (See fig.8.3.)

This circuit diagram basically consists of a cascaded 16-bit counter, D8222, D8223, D8224, D8226, which generates the X line and Y frame sweeps for the text raster and controls a multiplexer, D8232, D8233, D8234, D8236. This multiplexer addresses a video RAM, D8237, which receives its information from the microprocessor via a latch, D8238. The text in the video RAM is in ASCII characters and these are latched by D8239 into a character generator, EPROM D8241.

The 8-bit parallel outputs are fed into a shift register, D8242, which supplies a serial output to the Z control output. A 4-bit counter, D8231, provides hold-off at end of X line sweep to cut-off X and to give Z blanking.

A 6 MHz oscillator, gives a clock output D8218-8 to control the shift register and the 16-bit counter.

The text Y output is controlled via gates D8219 and flip-flop D8217. These various circuit functions are now described in greater detail.

#### The text Y sweep

The DSPL- signal from the text RAM (on CRT text diagram 1) is applied to flip-flop reset input D8217-13 to give a low output on D8217-3 transferred when a low clock signal is received from gates D8219. By applying the most-significant bits of the 16-bit counter (Q14, Q15) to NAND gate D8219, a low output from D8217-3 is designed to occur after the end of a Y sweep. This Y- signal is routed to the X/Z AMPLIFIER to restart the Y sweep.

#### The text X sweep

The 6 MHz oscillator consists of a 12 MHz X-tal controlled oscillator around V8206. D8221 divides the 12 MHz signal two times so that a 6 MHz square wave is available. This provides a clock signal (CLK) for the 16-bit counter (and for the shift register, described later), which uses the DSPL- as a master reset signal. The CLK signal provides an increment approximately every 160 ns. A cascade command is given to the next counter when a 4-bit counter is in state 15. With 256 counter states per X line, the end of line is reached at output D8223-15. This end of line output also changes over a flip-flop D8228 to provide an input command to counter D8231-7 which starts at the end of each X line. This provides a hold-off of 16 clock-pulses between X sweeps. During hold-off, a high output on D8231-13 is applied via two inverters D8229-13, D8229-10, to cut off the X- output signal between each text line.

A low MULT- input to the reset of flip-flop D8221 results in repeated X sweeps. At triggering by X-, the flip-flop produces a high output on D8221-6, which means that with D8219-3 at logic high during a Y sweep the NAND gate D8219-6 output is held low.

Consequently, the inverted signal (high) prevents triggering of flip-flop D8217-12 at the end of an X sweep.

Counter output D8231-13 also provides a trace blanking signal during hold-off via NOR gate D8229-1 and NAND gate D8228-8 to the Z AMPLIFIER. NOR gate D8229-1 is also controlled by a serial QZ signal from the shift register to provide unblanking for the character dots when writing text.

#### Generating the text characters

The previous sections have described the necessary XY timing signals that are routed to the X/Z AMPLIFIER to produce a raster on the screen by controlling linear sawtooth deflection voltages. The following sections explain how characters are written on to this blank raster. As in television the text characters are superimposed on the raster by video signals that modulate the trace spot intensity. In this case, character writing is achieved by unblanking the Z amplifier at various spots along each line where the characters occur.

Each character is formed by an 8x8 matrix and there is the possibility of 32 characters per line (i.e.  $8 \times 32 = 256$  points per line. As the screen is scanned line by line, a "character line" (8 lines) will be represented by  $256 \times 8 = 2048$  points. A full screen can accommodate 17 "character lines" (i.e.  $2048 \times 17 = 34816$  points. It follows therefore that all the 16-bit counter output bits Q0 to Q15 are necessary for character writing:

- bits Q0 to Q7 are used to represent the 256 points along a complete line,
- bits Q8, Q9, Q10 represent the 8-line character format and decide which of the eight lines is to be displayed,
- bits Q11 to Q15 represent the 17 "character lines" and decide which of these is to be displayed.

### Multiplexer

Counter output bits Q3 to Q7, Q11 to Q15 are applied as input signals to the multiplexers D8233, D8234, D8236. Alternatively, address bits from the uP are applied depending on the state of the CERAM-signal. When CERAM- is high, the counter outputs address the inputs of the video RAM via the multiplexer.

When CERAM- is low, the uP addresses the VIDEO RAM and data from the uP is written into the video RAM via the multiplexer.

Multiplexer D8232 uses the RD- and CERAM- signals to enable the video RAM.

### Video RAM

As described, the multiplexer provides inputs for the video RAM D8237 with either addresses from the uP or positional Q-bits from the counter. When the read input D8237-21 is active, data is loaded into the video RAM from the uP AD0 to AD7 lines via the bidirectional latch D8238. The text in the video RAM consists of ASCII characters. When a command is given to write a character this information is generated as 8 bits to the latch D8239, where it is passed after a time delay to (for synchronisation purposes) to address the character generator.

### Character generator

The character generator D8241 consists of a 4 kbyte EPROM, addressed by 12 bits:

- eight bits from the video RAM addressing the character to be generated,
- three bits, Q8 - Q10, representing lines 0 - 7 for the character (defining character height),
- an enable bit (EN).

The character codes generated are clocked as parallel outputs to the shift register.

### Shift register

The character parallel inputs to shift register D8242 are read out in serial form, controlled by the CLK output D8218-8 of the 6 MHz oscillator. Counter bits Q0, Q1, Q2, connected via NAND gate D8227-6 give a matrix address every 8 counter pulses on D8242-15 (defining character width). The serial output QZ is routed to NOR gate input D8229-3 to provide the required blanking/unblanking Z control for text display.

### Display sequence

The time during which the text is displayed represents a break in the normal oscilloscope signal trace. Normally this break only represents two character lines at the top of the screen and as the signal trace is repetitive, the break is distributed over different parts of the trace. It is therefore generally overwritten and only gives little disturbance of the signal.

However, when the full display area is used, for text during a service routine and for the 50-ohm overload warning, a large part of the signal is cut-off and the light intensity is somewhat reduced.

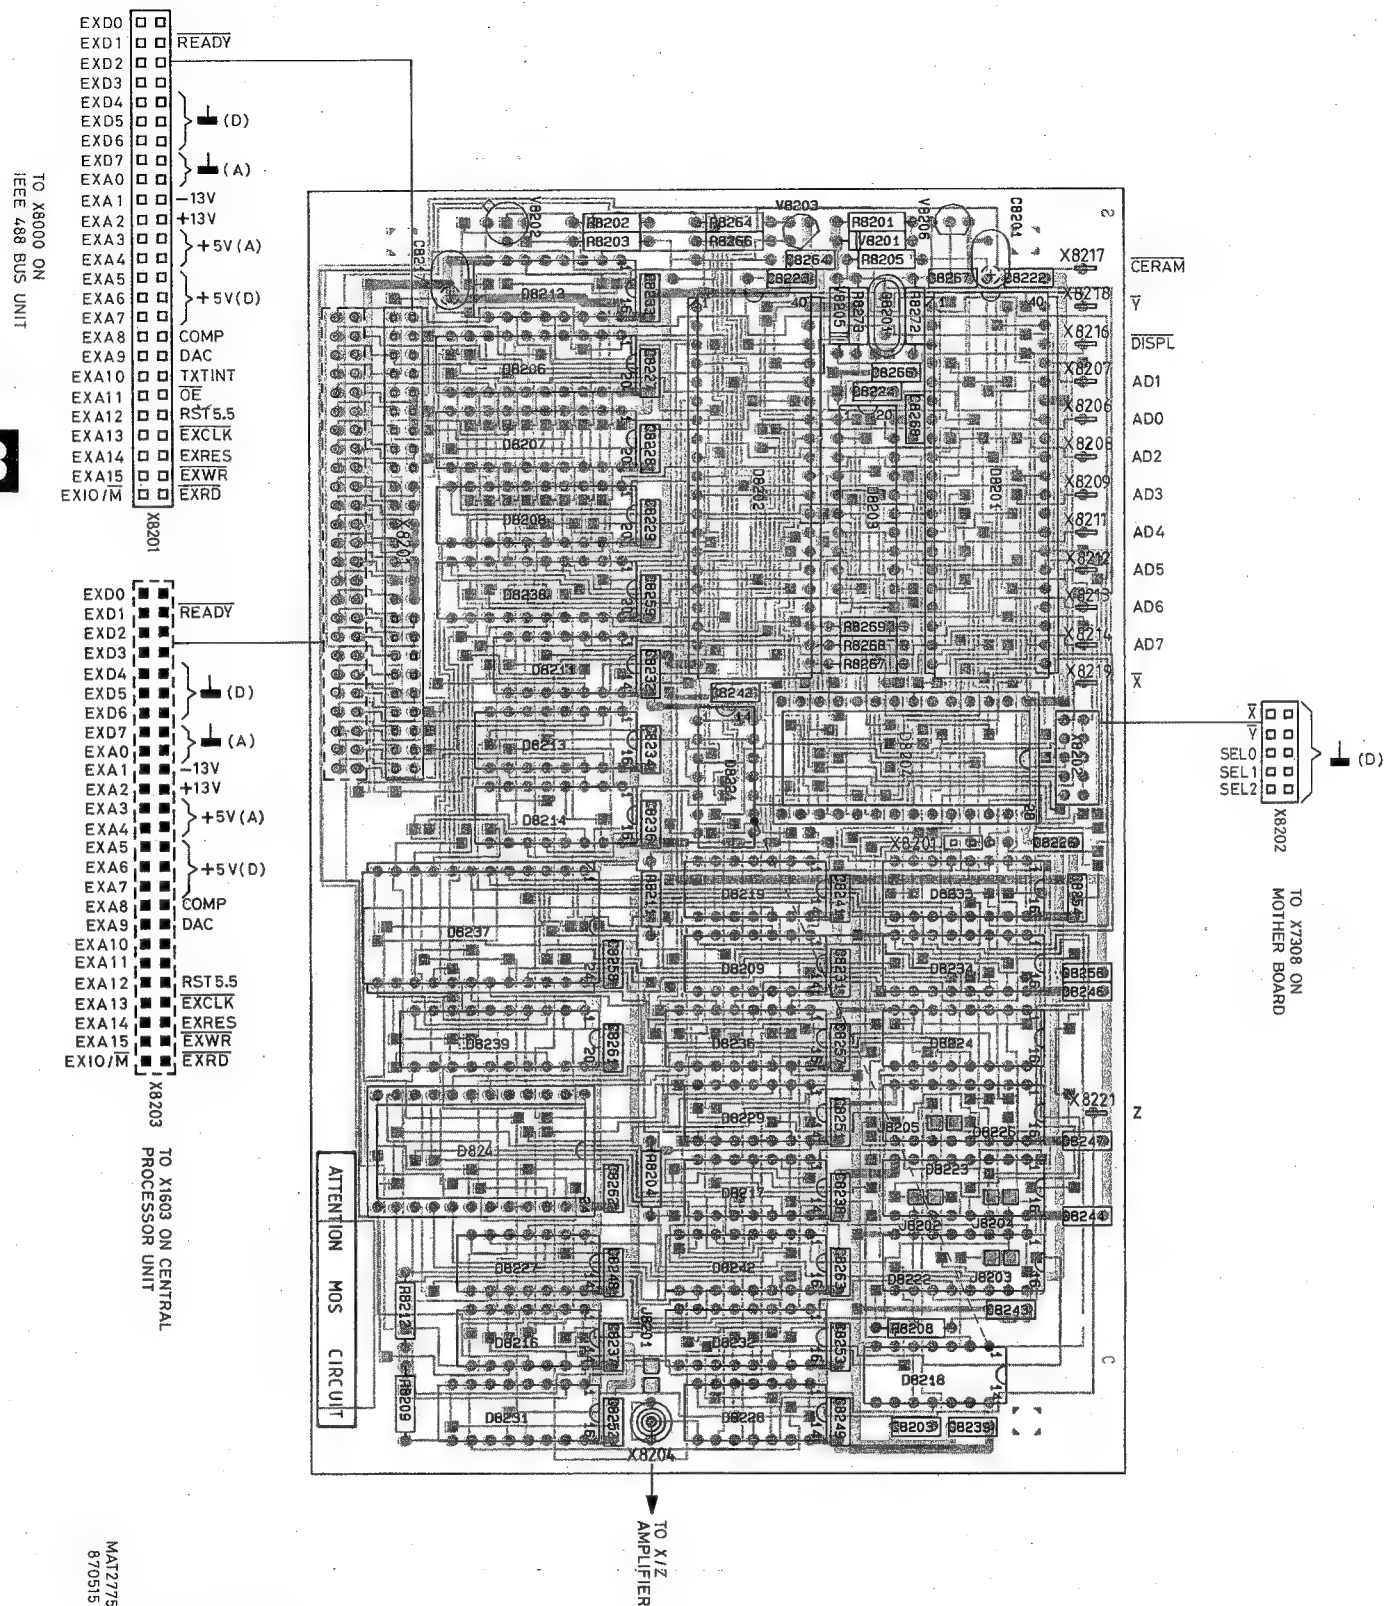

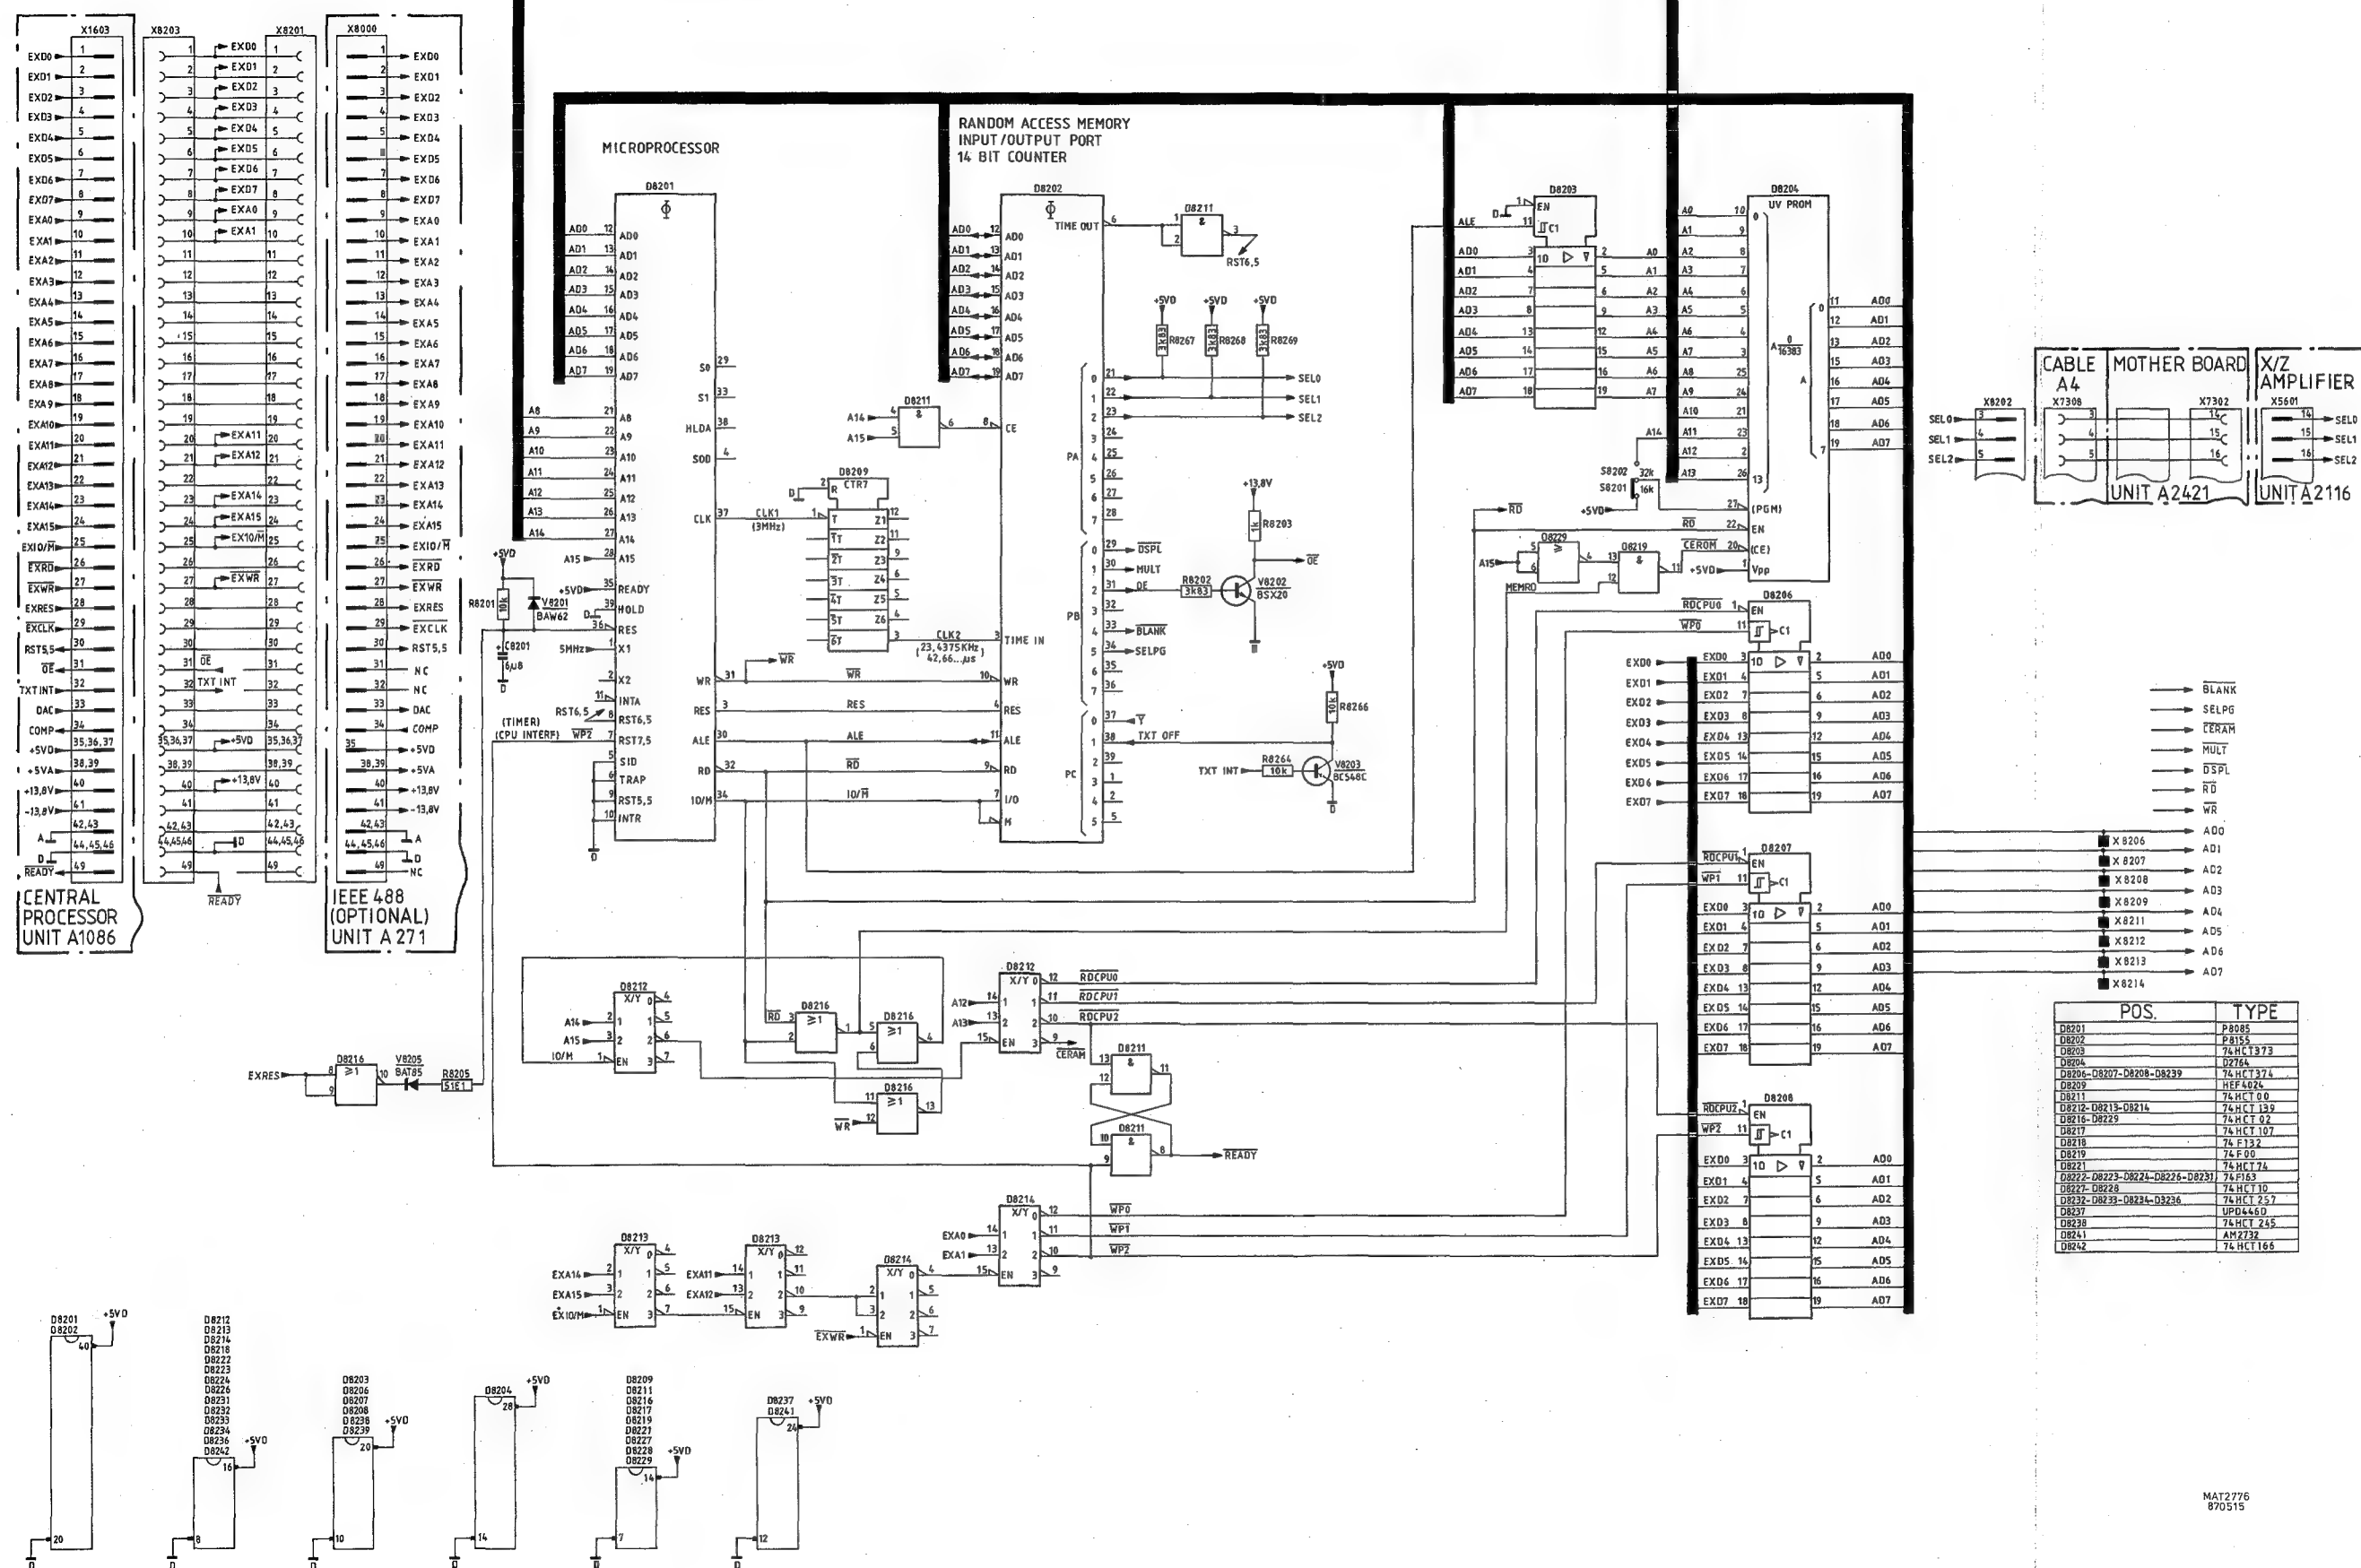

Fig.8.1. CRT text unit, p.c.b. lay-out.

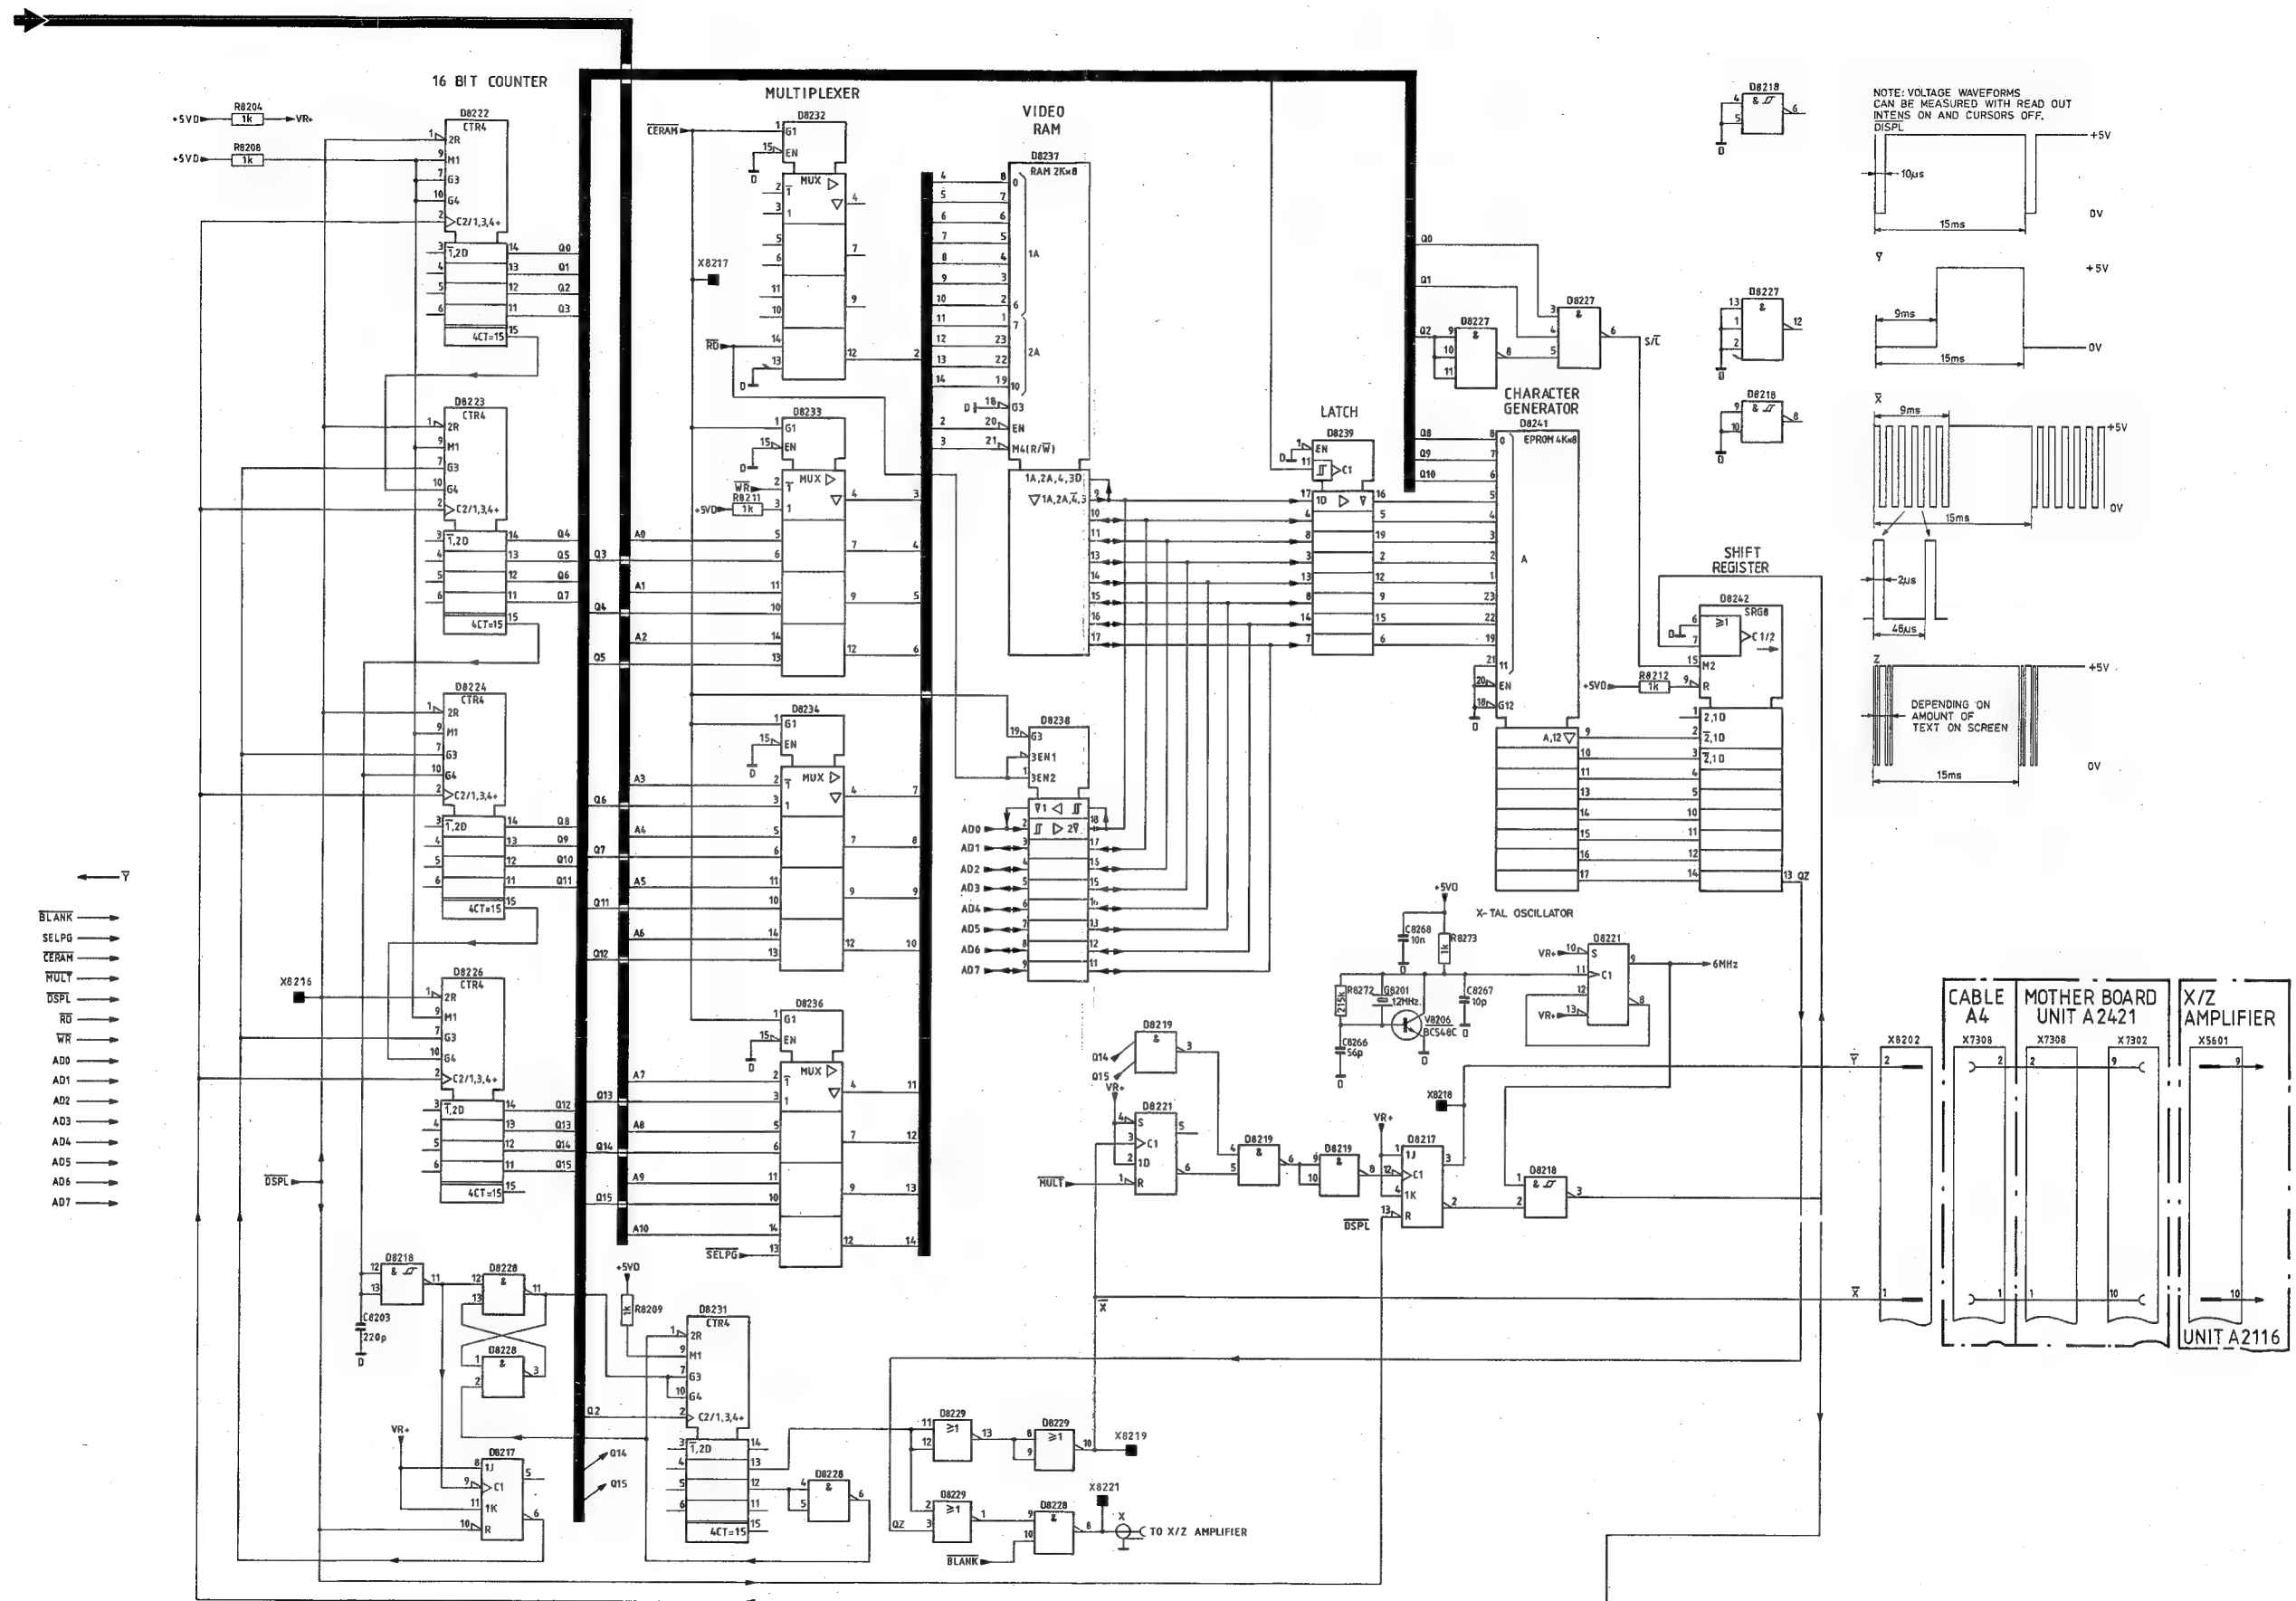

Fig.8.3. CRT text unit, circuit diagram 2.

## 8.3 PARTS LIST

In this section only electrical parts present on this unit are listed. Mechanical parts, including cables and connectors, are given in section 28.

## 9. CIRCUIT DESCRIPTION OF THE IEEE 488 BUS UNIT.

The IEEE-unit is an option that enables the oscilloscope to communicate externally with other instruments in a IEEE-bus system. It consists of two circuit diagrams, a digital part and an analog part. As the IEEE is an option, its operating details are not described in detail. For further information, refer to the relevant IEEE operating manual.

### 9.1. CIRCUIT DESCRIPTION OF DIAGRAM 1 (See fig.9.2.)

This digital part of the unit mainly consists of a IEEE control uP D8001, two buffers D8002, D8003, a read-only memory D8004 containing the IEEE instructions and a write register to control the analog part.

#### IEEE control uP and buffers

The IEEE control uP receives external data from the central uP on the bidirectional databus EXD0 to EXD7, controlled by EXRD- (read) and EXWR- (write) commands (when the remote facility is available). The lines are also used to read in data from the memory, D8004 and the write into registers D8008 used for controlling the analog part.

Another bidirectional port connects with buffer D8002 to form the external "multiline message" databus to the IEEE cable, controlled by the data valid "handshake" signal DAV on D8001-36.

The IEEE control is synchronised with the central uP clock by an EXCLK-input D8001-3.

The address lines EXA0, EXA1 and EXA2 on pins 21, 22 and 23 access eight internal registers that determine listener, talker and control communication modes.

Three bidirectional control lines connect to buffer D8003. This produces the five "RAISE" interface management bus lines:

REN - remote enable  
 ATN - attention  
 IFC - interface clear  
 SRQ - service request  
 EOI - end or identify

It also buffers the other two "handshake" lines NRFD (not ready for data) and NDAC (not data accepted) that together with the DAV signal control the exchange of data bytes between instruments.

#### Read-only memory

The read-only memory D8004 is switched for 16-kbyte capacity. It is addressed by the external address bus-lines EXA0 to EXA12 from CPU 1 circuit diagram, controlled by the EXRD- signal, and the CEROM-signal decoded from the EXA14, EXA15 and EXIO/M- addresses at output D8006-5. Together with the EXA11 and EX12 addresses an output from D8006-7 is used to decode a chip select signal CEIEC- on D8006-12 for the IEEE control uP.

#### Write Register for control of analog part of the IEEE-unit.

The EXA addresses decoded by D8006 also produce a signal on D8006-11. Together with the EXWR- signal this enables the write register via NOR gate and inverter D8007. In write register D8008, the inputs EXD0 to EXD7 provide the following outputs for controlling the analog part:

- MUX0 to MUX3 for multiplexer reading of potentiometer positions.
- S/H (sample and hold) selection
- D (data)
- E0, E1 output switch selection for potentiometers.

## 9.2. CIRCUIT DESCRIPTION OF DIAGRAM 2 (See fig. 9.3.)

If the IEEE unit is installed, the analog part of it is added between the potentiometers on the intermediate unit (voltage range 0.....10 Volt) and the circuits that are controlled by these potentiometers. These circuits are located on the signal unit, time base and final Y amplifier.

The analog IEEE part has the following functions:

- Selection between local (potentiometer voltage) operation or remote operation (voltage from a sample and hold gate) for every potentiometer function. This selection is done by means of multiplexers.
- Detection by the CPU of the position of a certain potentiometer (in advance manually adjusted). This potentiometer position is digitised by the CPU. This is achieved by comparing the potentiometer voltage (between 0.....10 Volt) with a sawtooth signal DAC from the CPU. The comparison is done in comparator N8013.

The comparator

The potentiometer position analog signals from the INTERMEDIATE UNIT on connector X8001 are selected separately in multiplexer D8009, controlled by the MUX0 to MUX3 signals from the digital IEEE unit via a 5 V to 12 V level adaptor D8011.

The selected output on D8009-1 is read into comparator N8013. Each voltage is compared in N8013 with a DAC staircase generator (on the CPU 2 circuit diagram) to determine its value. When the values are equal, a COMP signal is fed back to the CPU to stop the DAC. The uP starts the DAC at 0000 and generates a sawtooth voltage which is compared with the potentiometer slider voltage. When the sawtooth reaches the potentiometer voltage the DAC stops and the COMP output is routed to the central uP to indicate the position. The maximum position is indicated by the four-bit code 1111.

The sample and hold gates

The DAC value from the CPU, applied via R8007 to the common inputs (pin 3) of the sample and hold gates N8018-N8036, is therefore equivalent to the particular potentiometer voltage. This DAC voltage is clocked into a selected S & H gate by one of the signal addresses S0 to S14. The signal addresses S0 to S14 for the sample and hold gates are decoded in D8014 from four address lines at CMOS level, derived from the MUX0 to MUX3 inputs to D8011.

The two-position multiplexers.

The output from a sample and hold gate is connected to one input of a two-position multiplexer, D8037, D8038, D8039, D8041, D8042. For example, the output N8036-5 (SH14) is connected to input pin 5 of multiplexer D8042.

The other input is connected to its potentiometer position input signal; in this example, pin 3 connected to the slider of the potentiometer (connector X8001-19).

Each two-position multiplexer can be switched by a signal (P0 to X POS P14), stored in addressable latches D8016 or D8017 after level adaptation in TTL/CMOS adaptors D8012 or D8011 respectively; e.g. for X POS, the control signal is P14, stored in D8017 under control of the D (data) signal.

The outputs of the multiplexers are connected to the relevant analog oscilloscope circuits; e.g. HOLD OFF to TIME-BASE, or TSA (trace separation analog) to FINAL Y AMPLIFIER, etc.

This means that these analog oscilloscope functions receive their d.c. voltage from the sample and hold gate when the function is in remote operation or from the potentiometers in local mode. If the IEEE-unit is not installed, the potentiometer position signals on connector X8001 are directly connected to the analog oscilloscope circuits via connector X8002.

Fig.9.1. IEEE 488 bus unit, p.c.b. lay-out.

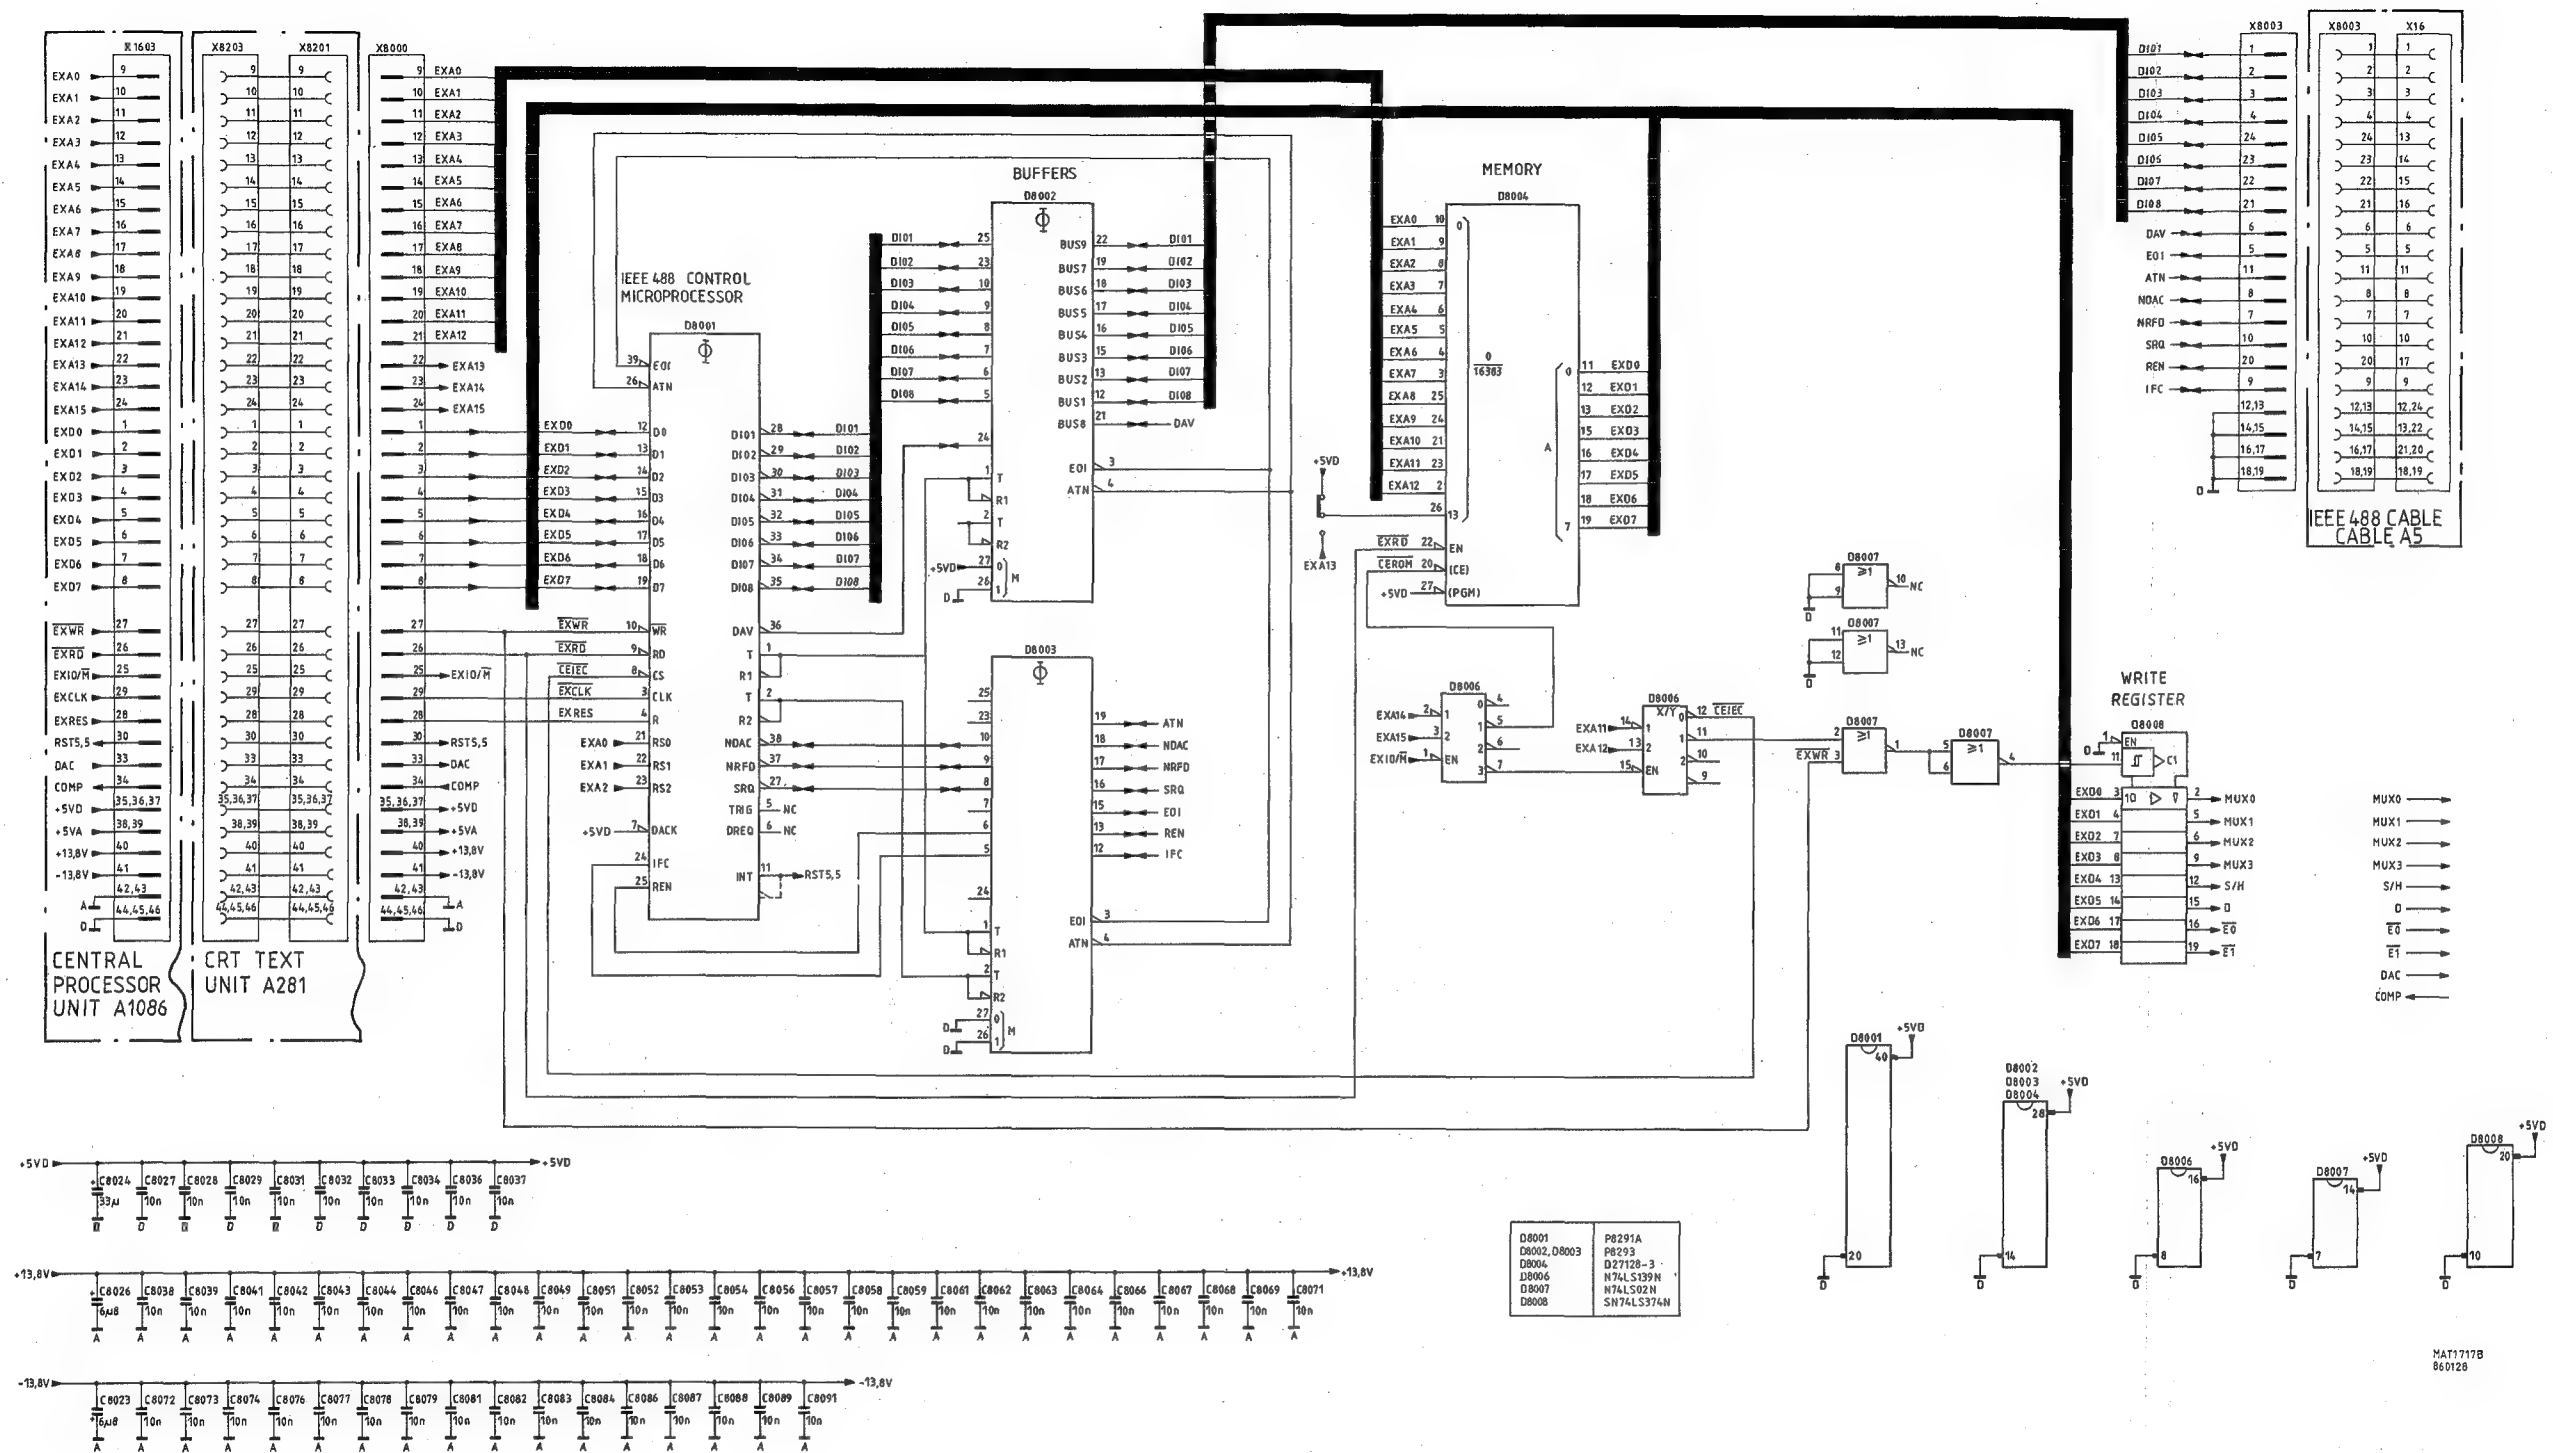

Fig.9.2. IEEE 488 bus unit, circuit diagram 1 (digital part)

## 9.3 PARTS LIST

In this section only electrical parts present on this unit are listed. Mechanical parts, including cables and connectors, are given in section 28.

## 10. CIRCUIT DESCRIPTION OF VERTICAL ATTENUATOR UNIT.

### 10.1 INTRODUCTION

The A and B channel attenuators are identical: so only A is described. Every attenuator unit consists of two printed circuit boards:

- the h.f. attenuator unit
- the l.f. attenuator unit

### 10.2 CIRCUIT DESCRIPTION OF SIGNAL PART OF THE HF ATTENUATOR UNIT (See fig.10.2).

The input from the Y BNC connector (A or B) divides into five paths:

- three identical a.c.-coupled h.f. signal paths with different capacitive attenuation factors.
- a 50-ohm termination path.
- a direct-coupled signal path to the l.f. attenuator unit.

The h.f. signal paths and the 50-ohm termination are selected by the contacts of reed relays mounted on the l.f. unit and controlled by buffer D6903. This buffer is controlled by the HEF-bus IC D7001) on the adaptation unit.

Dealing first with the 50-ohms termination, the reed relay contact connects the input signal across 50-ohms (an array with two 100-ohm resistors connected in parallel to earth). The array includes a temperature sensor which activates a temperature-sensing circuit N6803 if the input signal exceeds 5 V.

The three h.f. paths are a.c.-coupled via C6801 (0.01x range), C6809 (1x range) and C6814 (0.1x range), which form part of the RC attenuators. The attenuator stages are each followed by a FET impedance converter stage (V6806 in the 1x path). A diode clipper in the gate circuit of the two lower ranges protects the input source follower of the impedance converter from excessive input voltages. The impedance converter is switched by a PNP transistor (V6807) in its drain circuit. A +5 V switches it off and a +4.2 V switches it on. The signal is then coupled via a diode (V6812) to transistor V6829, part of a summation stage (where also the l.f. signal is added). When "0" coupling is selected, transistor V6828 takes over the current normally drawn by one of the coupling diodes (V6811 or V6812) in the h.f. path. This serves to maintain the circuit in d.c. balance. The gain of the summation stage is determined by the ratio of its collector resistance to its emitter resistance,  $\frac{R_c}{R_e}$ .

In the x1 position, the collector resistance of V6829 is  $R6851 + (R6850//R6853)$ , switched by V6819,

In the x5 position, used for the 2mV, 1mV/div, the collector resistance of V6829 is  $R6863 + R6852 + (R6853//R6854)$ , switched by V6822. In the x5 position the bandwidth of the summation stage is reduced.

Switching is achieved by the logic level applied to the base of V6826; -1 V selects the x1 range, +5 V selects the x5 range.

The output signal from the summation stage V6829 and V6833 is routed to the output amplifier with V6837 and V6839. The output signal from this amplifier is routed to the signal unit via a coaxial cable. A part of the output signal is routed to the feedback loop on the l.f. attenuator unit.

## 10.3

## CIRCUIT DESCRIPTION OF THE LF ATTENUATOR UNIT (see fig.10.3.)

The l.f. or d.c. path is chosen by the AC/DC reed relay switch contact. When "0" input coupling is chosen, the FET switch V6904 is switched off by a NUL- (-10 V) signal on its gate.

The signal on the d.c. path is fed to the operational amplifier N6901 together with the d.c. input (via R6909)

Any difference in the comparator is applied to the summation stage consisting of V6836, V6833 and V6829 on the HF unit. Note that when added, the h.f. signal and the l.f. and d.c signal shown at the summation stage form a reconstituted version of the square-wave applied to the input.

Feedback capacitors in the operational amplifier N6901 ensure that the frequency response of the d.c. path matches that of the a.c. path.

Feedback capacitor C6906 is always in circuit. The feedback capacitors C6907 and C6908 are switched into the circuit by the FET-switches V6906 and V6907. In the x0,1 attenuation position C6906 and C6907 are in circuit. In the x0,01 attenuation position C6906, C6907 and C6908 are all in circuit as feedback capacitance. The connection between the inverting input of operational amplifier N6901 and the output of the attenuator unit is made via a network of switchable feedback resistors. The amount of resistors switched into the circuit by FET-switches depends on the attenuator setting.

The feedback resistance networks are:

x1 : R6909 (always in circuit)

x0.1 : R6909, R6914, R6911, R6912, switched by V6911

x0.01: R6909, R6914, R6911, R6912, R6913 switched by V6911 and V6913.

In the x5 gain increase position, resistor R6916 in the feedback circuit is switched to earth by V6908 to provide the necessary correction.

## 10.4

## CIRCUIT DESCRIPTION OF THE AUXILIARY CIRCUITS ON THE HF ATTENUATOR (See fig.10.2)

There are three auxiliary circuits:

- Multiplexer D6801 for h.f. attenuator switching
- Window discriminator for 50 Ohm terminator protection (N6802)
- Temperature sensing circuit for 50-ohm input termination N6802)

Multiplexer D6801 is controlled by the HEF-bus (address lines A0 and A1) to select the x1, x10 and x100 capacitive attenuators for the h.f. unit, on pins 12, 14 and 15 respectively. These pins are connected with V6807/base, V6816/base and V6802/base.

The x1 and x5 ranges are also selected by switching -1 V or +5 V to V6826/base. These voltages are made by multiplexer D6801/3, 1, 5, 2, 4 and voltage divider resistors R6871 and R6862.

The window discriminator checks the voltage across the h.f. attenuator output by means of two operational amplifiers N6802. One detects the positive signal peak and the other detects the negative signal peak. The resultant outputs are summed, and if the input voltage of 5 V is exceeded (measured with the attenuator in the x0,1-position during this measurement), the summation amplifier N6802/8, 9, 14 switches off transistor V6842. This gives a logic high (unsafe) signal to the central microprocessor. In this situation it is not possible to switch from 1M.0hm to 50 Ohm input impedance.

#### Temperature sensing circuit.

This circuit consists of operational amplifier N6803. The temperature of the 50 ohm termination resistor is measured by a 1 kilohm resistor present inside N6804 with a temperature co-efficient of +0,75 percent per degree Celsius. If the temperature gets too high, operational amplifier input N6803/2 goes high and switches V6846 on. V6846 switches resistor R6890 between the probe indication line and earth. The central microcomputer knows that either a high-ohmic probe or a 50 ohm overload is present now. The detection between the two is done as follows:

- The window of the discriminator is changed from 5 to 25 Volt in combination with the x0,01 attenuator section), via a low level from opamp output D6803/1 applied to the window discriminator via diode V6843 and switching FET V6841.
- The microcomputer switches the x0,01 attenuator section on for a moment and looks at the discriminator output: if the output is low, the voltage across the 50 ohm resistor is between 5 and 25 Volt and the current through the ohm resistor is such that it can be switched off. With the discriminator output being high, the voltage is above 25 Volt and the current through the 50 Ohm resistor is too high to be switched off. Now a warning becomes visible for the user on the CRT of the instrument (if the text display is on).
- Some seconds after having switched-off the 50 ohm-resistor, the microcomputer looks again to the probe-indication line. The temperature-sensing resistor is cooled down again and the probe indication line must be free again; if not the microcomputer knows that it was not a 50 ohm overload but that a high-ohmic probe is connected.

## 11. CIRCUIT DESCRIPTION OF MTB/DTB EXTERNAL TRIGGER UNIT.

### 11.1. CIRCUIT DESCRIPTION OF MTB EXTERNAL TRIGGER INPUT (See fig.11.2.)

The control signals for this unit come from D7003 on the adaptation unit.

The MTB trigger input unit is similar to the vertical attenuator unit except that there are only two different attenuator positions, x0,2 and x0,02. Consequently, the MTB TRIG or X DEFL input socket is coupled to two h.f. paths and one l.f. path.

Alternatively, a LINE input signal can be switched via FET V4739 to provide triggering or X deflection.

The two h.f. paths have no input switching reed relay contacts.

The x0,2 attenuator consists of the L-network C4701, R4701, R4702, C4702 in the gate circuit of FET V4701.

A logic low control signal on the base of the base of V4728 causes this transistor to conduct, which turns on source-follower FET V4701. In turn, V4703 conducts and the signal is passed via switching diode V4704 to the summation amplifier V4709, V4711.

The logic low control signal is also applied to a switching network, V4719, V4721, V4722, which provides the collector load via diode V4727 for V4709 in the x0,2 position. The x0,2 gain adjust is R4751. The x0,02 attenuator consists of a double L-network C4707, R4708, R4709, C4708, and R4711, C4709, R4712, C4711 in the gate circuit of FET V4706. The control and switching circuits (V4731, V4726, V4724, V4723) are identical to the x0,2 position section. When the x0,02 position is selected, the gain adjustment in the collector load of V4709 is the V4753.

The l.f. path is connected via resistor R4777 to the AC/DC switch K4701, which is controlled by a reed relay in the collector of transistor V4748.

The a.c. path is via C4742 (two series capacitors to reduce leakage) and C4743 in series. Reversed diodes V4732, V4733 to earth provide input protection. With external triggering selected, FET V4734 is off and FET V4736 is on. The l.f. or d.c. signals are therefore fed via V4736 to pin 2 of operational amplifier N4701, together with the feedback signal from the output via R4761, R4783 and C4748 in the x0,2 position; also via R4784//R4785 and C4749 in x0,02 position as V4737 and V4738 are conducting (diode V4746 blocked by logic high from N4702/1).

The output on pin 6 of the operational amplifier N4701 is applied via the base of buffer amplifier V4713 to the summation amplifier V4711/V4709. Here, the h.f. signal and l.f. signals recombine. This reconstituted input signal is applied to V4717 and emitter follower V4718 which together form the low-impedance output driver stage. This driver stage feeds the MTB trigger circuit on the signal unit via a coaxial cable.

When LINE TRIG is selected, the EXT TRIG is inhibited by the LINE control signal applied to inputs 9 and 12 of operational amplifiers N4702:

- The LINE- output on N4702-8 cuts off the h.f. path FETs V4701 and V4706 via switching diodes V4729. This output also switches off the l.f. path FET V4736 via diode V4744. Transistor V4714 (switched on in LINE trigger mode) ensures that the circuit d.c. balance is maintained by taking over the current from the switching diodes V4704.
- the LINE output on N4702-14 switches on FET V4734 to short circuit the l.f. signal to earth via diode V4743. The LINE control signal also switches on FET V4739 to provide a LINE TRIG signal path via its source, V4738 and R4783 to the output. A parallel path is also provided via R4784//R4785.

The source-drain capacitance of FET V4738 (switched off in the x0,2 position) is prevented from giving cross-talk by the circuit V4742 and FET V4741. In the x0,2 position, a -14 V output on N4702-1 turns on V4742 and thus FET V4741, which clamps the drain to earth.

11

#### 11.2. CIRCUIT DESCRIPTION OF DTB EXTERNAL TRIGGER INPUT (See fig.11.3.)

The control signals for this unit come from D7003 on the adaptation unit.

The DTB trigger input unit is almost identical to the MTB trigger input unit except that there is no LINE TRIG input. There are two different attenuator positions, x0,2 and x0,02. Consequently, the DTB TRIG input socket is coupled to two h.f. paths and one l.f. path. The two h.f. paths have no input switching with reed-relays.

The x0,2 attenuator consists of the L-network C4801, R4801, R4802, C4802 in the gate circuit of FET V4801.

A logic low DTB control signal on the base of V4828 causes this transistor to conduct, which turns on source-follower FET V4801. In turn, V4803 conducts and the signal is passed via diode V4804 to the summation amplifier V4809, V4811.

The logic low control signal is also applied to a switching network, V4819, V4821, V4822, which provides the collector load via diode V4827 for V4809 in the x0,2 position. The x0,2 gain adjust is R4851. The x0,02 attenuator consists of a double L-network C4807, R4808, R4809, C4804, and R4811, C4809, R4812, C4811 in the gate circuit of FET V4806. The control and switching circuits (V4831, V4826, V4824, V4823) are identical to the x0,2 position. When the x0,02 position is selected, the gain adjustment in the collector load of V4809 is then R4853.

The l.f. path is connected via resistor R4877 to the AC/DC switch K4801, which is controlled by a reed relay in the collector of transistor V4848.

The a.c. path is via C4842 (two series capacitors to reduce leakage) and C4843 in series. Reversed diodes V4832, V4833 to earth provide input protection.

The l.f. or d.c. signals are fed to pin 2 of operational amplifier N4801, together with the feedback signal from the output via R4861, R4883 and C4848 in the x0,2 position; also via R4884//R4885 and C4849 in position x0,02 as V4837 and V4838 are conducting (diode V4846 blocked by logic high from N4802). The output on pin 6 of the operational amplifier N4801 is applied via the base of buffer amplifier V4813 to the summation amplifier. Here, the h.f. signal and l.f. signals recombine.

This reconstituted input signal is applied to the V4817 and emitter follower V4818 which together form the low-impedance output driver stage.

The source-drain capacitance of FET V4838 (switched off in the x0,2 position) is prevented from giving cross-talk by the circuit V4842 and FET V4841. In the x0,2 position, a -14 V output on N4802-1 turns on V4842 and thus FET V4841, which clamps the drain to earth.

12. CIRCUIT DESCRIPTION OF ADAPTATION UNIT (see fig.12.2.)

The adaptation unit, connected to the series HEF-bus, serves as the control unit for the vertical A, B, and EXT input units, which operate at 5 V TTL. It converts the 12 V serial bus input from the CPU to 5 V input and then back to 12 V for the other units on the mother board and time base. The unit comprises a high-to-low voltage translator D7004, which receives the 12 V level signals DATA 2, ENSCP and SERCLK in serial form from the CPU. This is converted to 5 V and routed on the adaptation unit through the serial data in/parallel data out HEF-bus decoders D7001 and D7002. Decoder D7001 controls the functions for the channel A input attenuator. D7002 does the same for channel B. The serial DATA out signal from D7002 is then fed to the low-to-high voltage translator D7006, which sends it on the DATA5 line at 12 V level to the mother board.

After serving the 12 V units on the mother board and time base, the serial data is returned to the adaptation unit on DATA8 and again converted into 5 V in D7004 to serve D7003, the last IC of the HEF-bus. D7003 controls the MTB/DTB external trigger input. The parallel outputs of the HEF-bus units, D7001, D7002 and D7003 appear on pins 4, 5, 6, 7, 14, 13, 12, 11 with the switching and ranging functions as shown on the diagram.

### 13. CIRCUIT DESCRIPTION OF SIGNAL UNIT.

#### 13.1. CIRCUIT DESCRIPTION OF DIAGRAM 1 (see fig.13.2.)

The signal unit follows the input attenuator circuits and is divided over three circuit diagrams.

- Diagram 1 containing the A and B amplifier channels, gain and channel selection.
- Diagram 2, which provides the MTB/DTB trigger filtering and amplifier circuits.
- Diagram 3, which provides the necessary control circuits.

#### A and B amplifier channels (diagram 1)

As the A and B channels are identical, only the A channel is described.

The 50-ohm unbalanced input signal for the A attenuator is applied to pin 3 of the integrated circuit N4903, the signal base of a differential amplifier.

Basically, N4903 (OM546) contains three identical common-base circuits responsible for the gain control (divide by 1, 2 and 4), a multiplier circuit and a normal/invert, channel on/off circuit. These circuits are controlled from the associated external networks as follows:

- Supply voltage adaption is achieved by n.p.n. transistor V4903 (provides +2 V on pin 28) and p.n.p. transistor V4904 (-10 V on pin 1).
- Gain adjustment is achieved by R4902 (GAIN), which provides a constant-current source with operational amplifier N4901 and transistor V4902. This constant current of 4 mA is applied to pin 29.
- Normal/invert is controlled by 0 V and +5 V logic signals on pins 11 and 12 derived from the HEF-bus:
  - CHAN A NORMAL input on pin 11 (+5 V normal, 0 V inverted).
  - CHAN A INVERT input on pin 12 (+5 V invert, 0 V normal).

This allows the inverted signals to be compared.

Transistors V4908 and V4907 provide current sources on pins 25 and 26, which should be almost equal for well-adjusted normal/invert balance. The balance potentiometers are:

divide by	potentiometer
1 :	R4927
2 :	R4928
4 :	R4929
2.5. :	R4931 (associated with the continuous control balance)

The trim-pots are selected by D4901 controlled from the HEF-bus.

- The continuous control, gain adjustment and extra 2.5 gain decrease for the least sensitive position of the instrument is achieved in the multiplier stage.

The continuous gain control output appears on the combined collectors of V4912 and V4914 (N4903-7). Any reduction in the 4 mA current applied to D4903/pin 7 results in a gain increase in the multiplier stage. If V4912 is on (5 V/div position) the current is determined by the CONT A (VAR) control and the preset R4952. A divide by 2.5 base signal on V4912 brings it into conduction and diode V4911 switches the control signal via the output of operational amplifier N4902 to the base of V4912.

The CONT A signal input range is from 0 V to +10 V. However, the first few degrees of rotation of the control have no influence on the output of V4916 because of the base-emitter junction voltage which has to be overcome. As the control has no mechanical OFF switch, this "dead-angle" allows it to be a few degrees off the fully anticlockwise position without giving an UNCAL error; i.e. V4916 is still non-conducting. As CONT A (VAR) is rotated further clockwise (UNCAL) V4916 conducts to give variable control between the calibrated positions. In all other gain positions except 5 V/div, V4914 conducts (divided by 2.5- signal on its base) and diode V4913 switches the control signal via the output of operational amplifier N4902 to the base of V4914. In this case, preset R4952 is not effective as it is in the feedback loop, and only the CONT A input is active.

- The trigger pick-off signals are fed from a balanced emitter-follower stage behind the multiplier (pins 21, 23) and these are routed to circuit diagram 2.
- This emitter-follower stage feeds a series feedback amplifier with an RC compensation network connected between pins 9 and 10 to speed-up the amplification at high frequencies.
- Finally, there are three identical common-base output circuits for the 3 output (pin 14 and 16) modes:
  - channel A output signal in normal mode
  - channel A output signal in inverted mode
  - no output signal in channel A off mode. Only the DC biasing current is coming from pin 14 and 16

The balanced 50-ohm output is applied to integrated circuit N5031 (OM547), the delay line driver. Here, the A and B channel inputs and the TRIG VIEW input from circuit diagram 2 combine.

#### Position control

Control of vertical position (and symmetry) is effected on common-base circuits internally connected to pins 1 and 30 of N5031.

Consider channel B is active:

A +12 V command signal at ON/OFF POS B switched on V5082 of long-tailed pair V5081/V5082. Current source V5083 supplies 14 mA to the collector of V5082. This current divides to provide the emitter currents of balanced amplifier D5081. The current division depends on the setting of the Y POS B potentiometer and the SYM B preset, which control the stage via emitter-followers D5081 (1, 2, 3) and D5081 (11, 12, 13). Position changes for channel B therefore influence the current applied the N5031/pin 1 and 30.

Consider the TRIG VIEW channel is active:

When TRIG VIEW is selected a +12 V signal via diode V5032 is applied to the slider of R5041 to give trace position control of the trigger view signal.

Consider channel A is active:

The circuit is identical to that of channel B as previously described. A +12 V command signal at ON/OFF POS A switches on V5047 of long-tailed pair V5046/V5047. Current source V5048 supplies 14 mA to the collector of V5047 which divides to provide the emitter currents of differential amplifier D5046. As for the channel B circuit, this division is influenced by the position of the Y POS A control (and SYM A control R5046).

Position changes again influence the current applied to N5031/pin 1 and 30.

The N5031 switching stage incorporates an h.f. compensation network between pins 21 and 22 and provides bandwidth-limiting, controlled by a +12 V signal BWL on pin 11.

## 13.2. CIRCUIT DESCRIPTION OF DIAGRAM 2 (See fig.13.3.)

The A trigger pick-off signal from diagram 1 is received on pins 7 and 9 of the A selection integrated circuit N5116 (OM611). Voltage adaptors V5116 and V5117 apply the supply voltages +2 V on pin 22 and -10 V on pin 3 respectively. Trigger source control signals MTBA (pin 15) and DTBA (pin 24) are switching the DTB and MTB trigger source signals from channel A. A control signal of +12 V switches the signal through; 0 Volt blocks the signal. Similarly, the B trigger pick-off from diagram 1 is received on pins 7 and 9 of the B selection integrated circuit N5121.

The MTB trigger signals from channel A or B and the EXT MTB trigger input signals, all at 50-ohm, are combined in a common-base input stage of the MTB filter integrated circuit N5126 (OM612). The EXT MTB is activated by a +12 V signal on the base of V5128, which switches the transistor off. In turn, this causes V5127 to conduct so that the EXT GAIN control R5127 on its base is operative. This varies the current to pin 28 to compensate for the magnitude of the externally applied signal.

The amplifier in the MTB filter is capacitively-coupled so that only the h.f. components are fed directly to the output (pin 17 and 19). The d.c. and l.f. components are blocked and taken out on pins 10 and 11 to a common-base amplifier V5129, V5131 and emitter-followers D5127.

The d.c. and l.f. components are applied by switches D5126 via three paths of different bandwidths (two l.f. and one d.c.) to a series-feedback amplifier D5127 with adjustable gain preset R5169. The switching conditions for these paths are:

DC = two D5126 switches on (contacts 8,9 and 10,11)

LF REJ = D5126 switches off (range: 20 kHz - 50 kHz)

The signal path consists of C5129/R5156 and C5131/R5157.

AC = two D5126 switches on (contacts 1,2 and 3,4): the range is 7 Hz-50 kHz.

The overall l.f. path gain, representing the 0 - 50 kHz range, has to match the internal D5126 signal path gain (for 50 kHz to full bandwidth).

The paths combine on pins 13 and 14 to provide the reconstituted signal output on pins 17 and 19.

These outputs are applied to pins 28 and 3 of the MTB trigger amplifier integrated circuit N5129 (OM613).

The filter section of the DTB is identical to that described for the MTB.

However, the DTB trigger amplifier N5228 (OM 613) has simpler associated circuits than the MTB trigger amplifier and is therefore described first.

Supply voltage adaptation is provided by transistor V5232 (+2 V) and V5241 (-10 V).

Transistors V5234, V5237 are connected as a balanced amplifier.

The balanced amplifier is influenced by the LEVEL DTB control signal. Normally, pins 24 and 6 of N5228 are at equal current division, but the LEVEL control disturbs the balance. Preset R5292 provides the +/- SLOPE balance.

Pins 11 and 13 provide a balanced output. The offset adjustment R5211 is adjusted to a no-signal zero at the Y output socket.

Preset R5310 provides level compensation to make the d.c. output voltage independent of the LEVEL control position. The current source V5248 is controlled by N5229

The DTB SLOPE control signals are applied to pin 16 of D5228. Negative slope is activated by a +12 V signal: positive slope is activated by a 0 V, which also switches on inverter V5239 and applies a positive signal to pin 21. The trigger signal can be shifted with the LEVEL DTB control. This shiftable signal is applied to a Schmitt-trigger input inside D5228. The output pulse from the Schmitt-trigger is available at pin 19 of D5228. The trigger pulses to start the DTB are fed via output pin 19 and connector X5227 to the time-base logic.

The MTB trigger amplifier has similar circuits to the DTB, but in this case, it is necessary to adjust the trigger level between the peak-to-peak level of the signal. A peak detector circuit N5128 (OQ0128) is therefore included.

This circuit is supplied with a voltage (0 ... 10 Volt) from the MTB LEVEL control and with output signals from pins 25 and 26 of the MTB trigger amplifier in order to detect the peak-to-peak level. These signals are routed to inputs 3 and 7 of the peak detector N5128. If AUTO is selected (+12 V applied to pin 13), the trigger can never exceed the peak-to-peak level of the signal. The input signal from N5129 pins 25 and 26 is also used to provide the EXT X DEFL output via V5134. This signal is routed to the X-deflection selector on the time base unit. Adjustable RC networks for trigger view square-wave compensation are connected across pin 25 and 26 of D5129.

The TRIG VIEW outputs on pins 11 and 13 are routed to the vertical channel switch on diagram 1.

The TRIG VIEW ON/OFF signal switches the TRIG VIEW display mode on via the circuit with V5143 and incorporated gain adjustment R5216. When the TRIG VIEW signal is ON (logic high), V5143 is switched off and the GAIN TRIG VIEW control R5116 can influence the base current of V5141 and hence its collector current (between 0...0,2 mA) applied to pin 15 of N5129.

When the TRIG VIEW signal is OFF (logic low), V5143 is switched on (current of 5,5 mA applied to pin 15) and V5141 is switched off.

The trigger pulses to start the MTB are fed via output pin 19 (4 mA/div) and connector X5128 to the time-base logic.

### 13.3. CIRCUIT DESCRIPTION OF DIAGRAM 3 (see fig.13.4.)

Most of the signal display functions are controlled by:

- a two-line bus system, serial clock (SCL) and serial data (SDA) from the CENTRAL PROCESSOR UNIT
- output enable (OE-) from the CRT Text Unit
- alternate clock (ALT CLK-) from the TB generator
- a CHOP CLOCK- derived from a 2 MHz chop oscillator formed by D5327 pins 8 to 12 with feedback via V5328. The output to D5326-7 is via transistor V5329.

The output control signals from D5326 are as follows:

- output pin 5 provides a direct output for the ON/OFF POS A control signal on diagram 1. It also provides CHAN A OFF, CHAN A INVERT and CHAN A NORMAL commands to diagram 1. An output via the emitter-follower level adaptor V5332 switches on channel A (+5 V on D5328-9 inverter input gives a low output on D5328-8). The +5 V on AND-gate inputs D5329-5 and D5329-9 also conditions the CHAN A INVERT and CHAN A normal signals. A parallel output signal from D5333-14 of the HEF-bus is fed via the emitter-follower level adaptor V5333 to provide the other gate inputs to select CHAN A INVERT or CHAN A NORMAL. A logic high input from D5333-14 switches via V5333 to give a CHAN A NORMAL signal via D5329-8 (output remains high). At the same time, the inverter output D5328-6 gives a logic low input to D5329-4 which inhibits the CHAN A INVERT signal (low on D5329-6).

Conversely, a logic low input from D5333-14 of the HEF-bus switches via V5333 to give a CHAN A INVERT signal via inverter D5328-6 and AND-gate D5329-6 (high). At the same time, a logic low in D5329-10 inhibits the CHAN NORMAL signal (low on D5329-8). These selection modes can be summarised in the following truth table.

OUTPUT SIGNALS TO CHANNEL A SWITCH N4903:  
 MODES SELECTED      CHAN A OFF      CHAN A INVERT      CHAN A NORMAL

CHAN A OFF	H	L	L
CHAN A NORMAL	L	L	H
CHAN A INVERT	L	H	L

- Output pin 1 of D5326 provides the ON/OFF TRIG VIEW signal used by MTB trigger amplifier N5129/pin 15 on diagram 2.
- Output pin 4 of D5326 provides the ON/OFF POS B output and the CHAN B OFF, CHAN B NORMAL/INVERT commands as described for channel A. The NORMAL/INVERT functions are controlled from HEF-bus line D5333-13 and the truth table is as follows:

OUTPUT SIGNALS TO CHANNEL B SWITCH N4967:  
 MODES SELECTED      CHAN B OFF      CHAN B INVERT      CHAN B NORMAL

CHAN B OFF	H	L	L
CHAN B INVERT	L	H	L
CHAN V NORMAL	L	L	H

- Output pin 8 (CHOP SWITCH) switches the 2 MHz chop oscillator via R5340: High = oscillator on  
Low = oscillator off  
An oscillator output via NAND-gate D5327 and V5327 provides a blanking signal to the X/Z amplifier during the channel change over period in the CHOP mode.
- Output pin 23 routes the DTB B signal to N5121/pin 24 on diagram 2.
- Output pin 24 routes the DTB A signal to N5116/pin 24 on diagram 2.
- Output pin 26 routes the MTB B signal to N5121/pin 15 on diagram 2.
- Output pin 27 routes the MTB A signal to N5116/pin 15 on diagram 2.
- Output pin 12 of D5326 connects the DTBS (DTB switch) signal to the Mother Board (delay=0 V, delay + delta t = +12 V). This signal is used on the time base unit.
- Output pin 11 of D5326 connects the TS (trace separation) signal to the Final Y Amp control (MTB trace = 0 V, DTB trace = +12 V)
- Output pin 10 of D5326 connects the TBS (time-base switch) choice via the Mother Board (MTB = +12 V, DTB = 0 V). This signal is used on the time base unit.

#### 14. CIRCUIT DESCRIPTION OF FINAL Y AMPLIFIER (See fig.14.2.)

The final Y amplifier is thin-film IC N4004.

The amplifier drives the vertical deflection system of the CRT. The main input signals for the amplifier are the vertical deflection signal from the delay-line cable (applied via X4007/pin 1 and 2) and the vertical positioning signals for the text (applied via coax input sockets X4011 and X4012).

The vertical deflection signal from the delay-line is applied at 50 ohm impedance level to the bases (pin 4 and 25 of N4004) of a series-feedback amplifier consisting of two PNP transistors. The emitters of these transistors (pin 1 and 28) are connected with circuitry for square-wave compensation. C4018/C4019/R4050 is used for high-frequency compensation. For the lower frequencies are used C4012/R4034, C4014/R4041, C4016/R4039 and C4036/R4038; the high frequencies are blocked via the chokes L4001 and L4002. For the highest frequencies there are two circuits with varicap diodes present inside N4004. The varicaps are adjusted with DC-voltages coming via the trimming potentiometers R4047 and R4048. The current for the emitters (pin 1 and 28) of N4004 is coming from current source V4006. This current is divided via V4003 and V4004.

In spite of the compensation circuitry described above, the amplifier N4004 shows considerable errors for square-wave signals with frequencies under 100 Hz. The circuit between the operational amplifiers N4001 compensates for this. The inputs 5 and 6 of N4001 receive via low-pass filters the low-frequency components of the signals from the delay-line. N4001 adds these two signals. The output (pin 7) of N4001 feeds four different integrating networks with different time constants. The signals from the integrators are picked off via trimming potentiometers. The potentiometer signals are added at the input (pin 2) of operational amplifier N4001. Compensation is achieved because the output (pin 1) of this amplifier is connected with the base of V4003.

The amplifier IC N4004 drives the c.r.t. deflection plates via the coils L4006, L4007, L4008 and L4009. L4006 and L4007 have adjustable cores for square wave adjustment. V4008 is a current source for the output amplifier circuit inside N4004.

The trace separation for the MTB and DTB displays, and the Y sawtooth time-base for the CRT text/cursor display are applied to the main Y amplifier input via a balanced amplifier V4013/V4014. This amplifier is fed by current sources V4011, V4012 and V4016. This balanced amplifier is controlled by the outputs of multiplexer D4003.

The switching control signals for D4003 are as follows:

- OEN - the text enable signal (+12 V) on V4001/anode, which is routed to input D4003-9 and via diode V4001 of a discrete OR-gate to D4003-10.
- TS - the trace separation signal for MTB (0 V) or DTB (+12 V) which is routed to input D4003-11
- TSD - the single (+12 V) or alternate (0 V) time-base signal which is routed via diode V4002 of a discrete OR-gate to D4003-10.

These three switching control signals select the following trace deflection signals: The analog trace separation signal TSA (0 - 10 V) on R4012 which is applied via an operational amplifier to give a +7 V to +5 signal on input D4003-13 determined by the position of the TRACE SEP control. This output from the operational amplifier is inverted in a second operational amplifier to give a corresponding signal of +5 V to +7 V on input D4003-12, determined by the position of the TRACE SEP control. These two inputs are selected as the base-signal for V4014 by the TS signal (MTB = 0 V, DTB = +12 V) on D4003-11.

The selected output is routed via output D4003-14 to input D4003-2. If alternate TB is selected and text OEN is off, the 0 V input on D4003-10 switches the selected alternate TB square-wave on D4003-2 via output D4003-15 to the base of V4014.

If text OEN or the TSD single TB signal (+12 V) is applied to input D4003-10, then the fixed +6.3 V on D4003-1 is switched via output D4003-15 to the base of V4014. TEXT Y sweep sawtooth signal is applied to input D4003-3, selected by the OEN (+12 V) signal. The output D4003-4 is applied to the base of V4013 of the balanced amplifier. If text OEN is inactive (0 V), a fixed +6.3 V on input D4003-5 is switched via D4003-4 to the base of V4013. The operational amplifier N4005 is used for LF square-wave compensation during the time that text is written on the CRT-screen; during this time is the control signal OEN active and low. This compensation is achieved by means of a simple comparison of the balanced (antiphase) signals at the text inputs (X4011 and X4012) and the outputs of the final amplifier (pin 17 and 12 of N4004 via miniature resistors at the conductor side of the p.c.b.). Trimming potentiometer R4070 is used for adjusting the vertical position of the text on the screen. Comparison is done at the inputs (pin 2 and 3) of N4005. The output (pin 6) drives the base of V4004 via bridge X4013 (open during calibration) and electronic switch D4009/3,4,5 (only closed when text is written).

## 15. CIRCUIT DESCRIPTION OF TIME BASE

### 15.1. MAIN TIME BASE CIRCUIT DESCRIPTION (See fig.15.12)

#### MTB trigger input circuit and logic.

The positive going MTB trigger current signal is applied via a 50 ohm adaption resistor R9101 to the common-base transistor V9101. The series feedback amplifiers V9351 and V9352 convert the input voltages signal into symmetrical current signals. The gain of this stage is determined by R9354. These current signals are fed to a Schmitt-trigger circuit to sharpen up the edges of the trigger pulse. This Schmitt-trigger circuit consists of V9354, V9353, V9356 and V9357.

This circuit is biased in such a way that very fast switching is achieved.

The output voltage signal is fed via two emitter-followers V9358 and V9102, which function as a buffer, to the clock-inputs of D-type flip flops D9101.

This flip flop consists of 3 parts, each having different functions, as follows:

- D9101-3-4-7-8 is the trigger detect flip-flop
- D9101-17-18-13-14 is the time-base start flip-flop
- D9101-2-23-11-12 is the jitter elimination flip-flop

The delay of lns between the trigger input circuit and D9101-16 compensates switching delays in D9101-2-23-11-12, thus providing very fast triggering.

#### AUTO free run mode (no triggers)

In the AUTO (free run) mode, the start logic circuit operates as follows: (see also fig.15.1)

The AT- signal from the HEF-bus is low (after level adaptation) and this low is applied to input 4 of NOR-gate D9102.

The SR- input from the HEF-bus is high, so diode V9017 is blocked and transistor V9103 is off. This gives a low on the other input of NOR-gate D9102 (3) and on S of D9101 (18). This means that the S input of D9101 (18) is low and the R input (pin 17) is high, which is the start condition for automatic triggering in the free-run mode; i.e. Q- output (pin 13) is high and a start MTB signal is given.

During a sawtooth sweep, the EOS1 (end of sweep) signal fed back from the sawtooth generator output to the S input of D9101-23 is low. Reset input D9101-2 is high because of inverter D9102-1-2-7-8. This gives a low Q (D9101-11) output which is connected directly to the S input of START flip-flop (D9101-18). (E.O.S.2)

With inputs R (D9101-17) and S (D9101-18) both low, the output Q (D9101-14) is low and Q- is high. This means that the Q output is held high during the MTB sweep.

At the end of sweep the EOS1 signal goes high, the Q output D9101-11 goes high to make the S input of start flip-flop high. In turn, the Q- output D9101-13 goes low to end the sweep (no START MTB signal).

After the hold off time EOS 1 becomes low again (gives main time base free). Yet input of D9101-23 is low. Reset input is high (via D9102-1-2-7-8). This gives a low Q output, which is directly connected to the S input of the start flip-flop (D9101-18).

With reset input (D9101-17) high and set input low (D9101-18), the output Q- (pin 13) is high, so the time base generator is started for the next sweep.

For blanking purpose, the EOS1 signal and the Q output of the Start flip-flop are fed to the two-input NOR-gate D9102 (23 and 24). During the sweep both inputs are low and a high output gives Z unblanking. At the end of the sweep both inputs are high and a low output gives Z blanking.

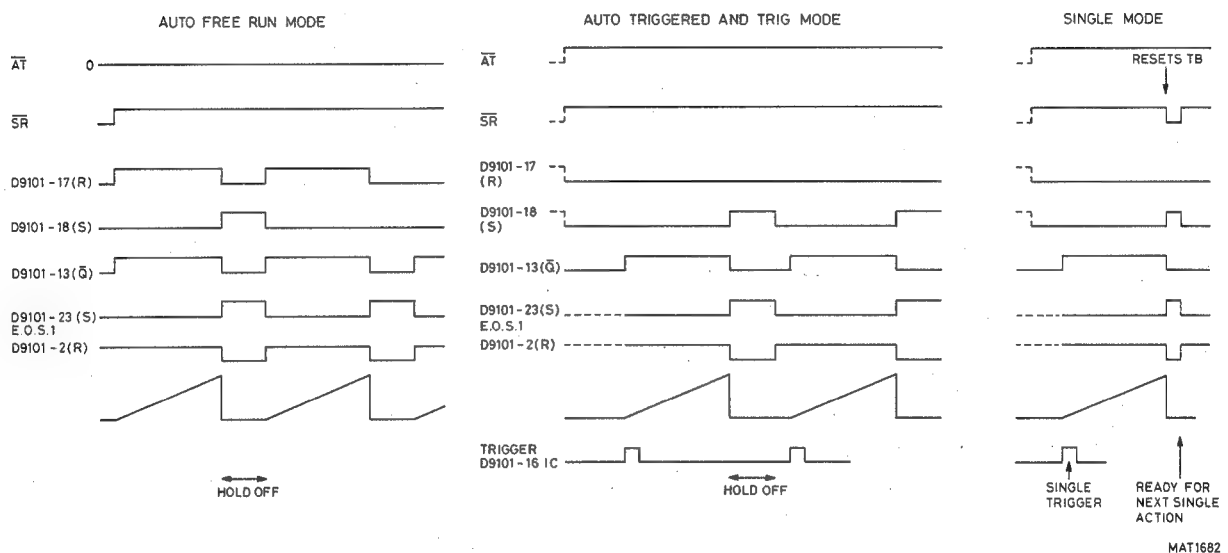

Fig.15.1.Voltage wave forms in MTB circuits

#### AUTO triggered and TRIG mode (see fig.15.1)

In the AUTO triggered and TRIG mode the AT- signal is high, which gives a high on NOR-gate D9102-4 making the reset input of D9101-17 low.

SR- (coming from the HEF bus) is high, therefore diode V9017 is blocked and the high on the base of V9103 holds this transistor off. The set input of D9101(18) is therefore low.

With the S and R inputs low, this is the start condition to accept triggers. When a trigger arrives on the clock input (16), the data (earth) on the D input (D9101-15) is clocked out on Q (Q is low). Conversely, the Q- output is high, which provides the START MTB trigger signal on X37 to start the MTB sawtooth generator.

During the sawtooth sweep, the EOS1 (end of sweep) signal fed back from the sawtooth generator output to the S input of D9101-23 is low. Reset input D9101-2 is high because of inverter D9102-1-2-7-8.

This gives a low Q output which is connected directly to the S input of START flip-flop (D9101-18).

With inputs R (D9101-17) and S (D9101-18) both low, the output Q (D9101-14) is low and Q- is high. This means that the Q- output is held high during the MTB sweep. At the end of sweep the EOS1 signal goes high, the Q output D 9101-11 goes high to make the S input of the start flip-flop high. In turn, the Q- output (D9101-13) goes low to end the sweep. After the hold off time EOS 1 becomes low again (gives main time base free). Yet input of D9101-(23) is low. Reset input high (via D9102-1-2-7-8). This gives a low Q output, which is directly connected to the S input of the start flip-flop (D9101-18). This start flip-flop is in start condition, S and R input both low, and waits on a trigger signal on the clock input (16).

As stated, D9101-2-23-11-12 flip-flop eliminates jitter that could be caused by high frequency trigger pulses occurring during the MTB sweep. At frequencies higher than 50 MHz, a divide-by-two circuit formed by R9193, R9194 and C9107 in the input circuit of D9102-1-2-7-8 operates to skip alternate trigger pulses. During a sweep, the S input of D9101-(23) is low (EOS1 inactive). Both inputs of D9102-(1 and 2) are low, therefore the R input D9101-2 is high, giving a low output on Q. This is connected to the S input of D9101-(18), which is low already, so triggers on clock input of D9101 have no effect on the START flip-flop.

At the end of MTB sweep the S input of D9101(23) is high (EOS1 active).

If the trigger frequency is higher than 50 MHz then the divide-by-two circuit holds the lower input of D9101-(1) high, so the output low is applied to the R input of D9101-(2). The high Q output is routed to the S input of D9101-(19). Considering the R input of D9101-(17). The SR- signal input is high, therefore it gives a low to the upper input of D9102-(3), which is not effective because this input is high (high already on S).

The AT- input is high in AUTO triggered so the lower input of D9102-(4) is high. Together with the high on the upper input gives a low output, which is applied to the R input of D9101-(17). In this set state (S high, R low), Q is high and Q- is low, so the unwanted trigger is skipped.

#### SINGLE mode (see fig.15.1)

In SINGLE mode the hold off sawtooth generator is switched off (V9134 conducts).

If the button Single is depressed the start flip flop starts the MTB sawtooth generator once on receipt of a trigger on the clock input (D9101-16). The set and reset input are both low because AT- and SR- are both high (see AUTO triggered and TRIG mode).

The main time base generator sawtooth is high at the end of the sweep (D9102-19).

The MTB generator must be immediately reset for the next SINGLE action because the hold off is switched-off.

This is done by the SR- signal, which is low for a moment. At the moment that SR- is low, V9103 conducts, D9101-18 (set) is high and D9101-17 (reset) is low.

So the Q- output 13 is low.

15

SR- low for a moment gives that V9129 conducts, so a logic high is fed to the MTB-HOLD OFF logic D9102-18. As a result EOS1 becomes low, which results in D9101-23 low and D9101-2 high and D9101-11 low. Now the main time base logic is ready for the next SINGLE action (on receipt of a trigger).

#### Trigger detection mode (during AUTO free run.)

Trigger detection during the MTB sweep is done via D-flip-flop 9101-3-4-7-8, NOR GATE D9004-1-8-2-9 and inverter D9004-3-6.

This trigger detection circuit gives also setting information to the uP via TBS1 during the AUTO SET mode (see section: AUTO SET mode).

To indicate the uP if there are trigger pulses during the sweep, the circuit functions as follows:

In this mode the signal TBS0 is high; input 8 of D9004 is also high, so output 9 is low, independent of the other inputs.

This output is clamped to ECL level by diodes V9006/V9007 and the level adaptor V9002.

The low level on D9004-9 is fed to the data input of D9101-(6).

The reset input 4 is low. The set input 3 is low, because TR- is high and V9001 blocks.

With set and reset input both low the data input level (low) is clocked out on the Q-output 7 when a trigger occurs on the clock input 5.

This low Q output is fed as TBS1 to the uP to indicate that the NOT TRIG'D LED must be switched off.

Every 100 ms the TR- signal is low to reset the trigger detection circuit. If TR- is low for a moment, V9001 conducts and a logic high is fed to the S input 3 of D9101, which results in a high Q output 7. When TR- is high again the uP reads TBS1

- If no trigger pulses were detected the Q output 7 will still be high, so TBS1 is also high.

This results in AUTO mode for AUTO free-run of the time base.

In TRIG mode the uP will switch on the NOT TRIG'D led (no trace).

- If a trigger pulse was detected then the Q output 7 is low (TBS1 also low) and the time base is triggered on receipt of the next trigger pulses (clock-pulses).

#### AUTO SET mode

To give setting information for AUTO SETting to the uP, via TBS1, the trigger detection circuit functions as follows:

In this mode TBS0 is low.

This means that output 9 of D9004 depends on the logic levels on inputs 1 and 2.

Input 1 is high during the MTB sweep, so output 9 is low during the sweep.

The data input D9101-6 is also low.

At the moment that TR- was low and the set input D9101-3 was high, the Q output 7 was set to high level.

After TR- (so TR- is high) the set input D9101-3 is low.

With both set and reset low, the data input level (low during sweep) is clocked out on Q on receipt of a trigger on the clock input D9101-5.

So if a trigger occurs during the sweep, Q output D9101-7 is low. This low Q output is held via the D9004-3-6 inverter on input D9004-2 as follows:

Input D9004-3 is low, so output 6 is high. Input D9004-2 which is also high holds the data input 6 of D9101 low.

If the uP has read the low TBS1, the TR- signal is low again (every 100 ms). This makes D9101-3 (set input) high. As a result the Q output D9101-7 is high again and ready for the next detection action.

If no triggers occur during the sweep then the D flip flop D9101(5) has no clock pulses so the output Q stays high.

If in between the time base sweeps triggers occur on the clock input D9101-5 then the situation is as follows:

The three inputs of D9004(2-8-1) are low.

Output D9004-9 is high, so on triggers (clock pulses) a high is clocked out on Q output D9101-7, so TBS1 is high in between the sweeps (no trigger detect situation).

#### MTB Sawtooth Generator

The START MTB pulse from the Start flip-flop Q output is converted from a positive-going voltage to a current and applied to the common-base transistor V9108. The collector voltage is clamped at +1.5 V ... -0.6 V (ECL level) by diodes V9112, V9111 and V9109. The signal is then fed two ways via resistors and speed-up capacitors.

The switching transistors V9113/V9116 take over the current from the MTB CURRENT SOURCE at flyback. The START MTB pulse switches V9113 on and V9116 blocks. The constant current is applied via diode V9117 to charge the timing capacitors. At the end of the START MTB pulse (at flyback), V9113 is switched off and V9116 conducts to take over the current of the current source; i.e. it is not fed to the timing capacitors. The buffer V9121 is inserted to provide sawtooth isolation.

The switching transistors V9114/V9118 are used to discharge the timing capacitors during flyback.

The START MTB pulse switches on V9114 and V9118 blocks. At the end of the MTB START pulse (at flyback), V9118 is switched on by the negative slope of the START MTB pulse and quickly discharges the timing capacitors. Diode V9119 prevents a current surge by V9118 after discharge.

The small timing capacitors C9114, C9117 are permanently in circuit. For the slower ranges, extra capacitors are switched in; namely, C9116, controlled by M2 from the HEF-bus via V9122, and, for the slowest time-base settings, C9118, controlled by M3 from the HEF-bus via V9123 (see fig.15.2).

The sawtooth waveform is buffered by FETs V9141 and the two emitter-followers V9124 and V9126, which compensate for base-emitter voltage changes. The low-impedance output is applied via the common-base transistor V9128, which provides a current MTB sweep output to the HORIZONTAL SELECTION circuit. Transistor V9142 provides the current source for the output stage. Another signal path is via emitter-follower V9127, which acts as a sawtooth isolator. This emitter output is low during the sweep but goes high momentarily at the end of the sweep.

As a result, a current is fed to the operational amplifier and compared to the current at the positive input to give a fixed output voltage. This voltage is taken off by a multiplexer (D7403) controlled from the HEF-bus (S0, S1 and S2, see fig.15.2.) to give the range CAL voltage ( $U_{CSM}$ ) on test-point X28. In the CAL position (VAR control clockwise) the  $U_{CSM}$  has seven voltage steps for the time base position x0.5, x1, x2, x5, x10, x20, x50.

However, in the UNCAL position of the VAR control R11, current is drawn from the level shifter negative input, which means that the  $U_{CSM}$  at the multiplexer output is reduced to cover the gap between steps depending on the setting of the VAR control. This operates as follows. When the VAR control R11 is increased, N9701-3 input goes high and consequently the high output on N9701-1 causes V9701 to conduct and draws current from the seven-step resistor network. This produces a corresponding reduction in the  $U_{CSM}$ . To prevent errors in the CAL position of R11 (which is not mechanically switched), the pre-voltage of +100 mV on the emitter of V9701 gives a dead angle for the potentiometer, as explained.

#### MTB current source.

The  $U_{CSM}$  on X28 is applied to the actual current source stage, consisting of operational amplifier comparator N9702 and transistor V9708. The current source is derived from the +18 V on this comparator (pin 7), the  $U_{CSM}$  giving a fixed output on N9702-6 to drive the current transistor V9708. The  $U_{CSM}$  is proportional to the time-base settings; e.g. the lower the  $U_{CSM}$  the lower the current  $I_{MTB}$  to the MTB sawtooth generator (emitter of V9121).

In the x100 position a high logic signal from the HEF-bus (M100, see fig.15.2) switches on the reed relay K9704 via V9719 to switch R9729 in parallel with R9728 in the emitter circuit of V9708. A reed relay is used to reduce errors that would otherwise be caused by any contact resistance. In this way the current  $I_{MTB}$  is increased 100 times.

#### Hold off current source.

A HOLD OFF current source is included, which is driven from the  $U_{CSM}$  (X28) when adapted to the time-base setting, or from a fixed potential at 0.5 us and faster sweep speeds. When COM- is high (not active: 1 s ... 0.5 us) the  $U_{CSM}$  from the MTB current source is applied via selector switch D9707 contacts 4 and 3 to the positive input of comparator N9161. The hold-off current source is then derived from the +18 supply to N9161 via the current transistor V9716.

When COM- is low (active: 0.5  $\mu$ s ... 10 ns) the fixed potential  $U_{CSH}$  on D9707-1 is applied via the selector switch D9707 contacts 1 and 2 to the positive input of comparator N9161. Switch D9707 contacts 8 and 9 serve as an inverter for the COM- signal to activate D9707-13. In the x100 position the M100 input (high) from the HEF-bus switches on V9719, which in turn switches on V9717. This connects R9738 with R9737 to give x100 hold off current  $I_{HO}$ , which is fed to the HOLD OFF sawtooth generator collector of V9133). The x100 for the MTB current source, reed relay K9704, is also switched on via V9719 as described.

#### The Hold off sawtooth generator.

The EOS4 signal corresponding to the high point of the MTB sawtooth waveform is routed as a low start signal for the hold-off, which blocks V9131, which also acts as a level adaptor (12 V to 5 V level). In turn, this blocks the current switch V9133. The HOLD-OFF CURRENT SOURCE feeds the switching transistors V9133/V9134. During the hold-off period, these transistors are blocked and the current charges the hold-off timing capacitors.

At discharges (the flyback period), V9133 conducts to take over the current from the current source. Transistor V9134 is controlled from the HEF4094 bus, D7301-13, which is located on the motherboard to switch off the hold-off function in the SINGLE mode. A high input on its base switches it on, thus preventing the timing capacitors from being charged. Timing capacitor C9129 is permanently in circuit and determines the minimum hold-off period to allow the MTB timing capacitors to discharge completely. The other timing capacitors are switched in:

- C9131 by V9136, controlled by H2 from the HEF-bus } See fig. 15.2
- C9132 by V9137, controlled by H3 from the HEF-bus. }

The hold-off sawtooth is picked-off via two emitter followers V9138/V9139 in Darlington configuration, which compensate for base-emitter voltage variations and give a low-output impedance.

The HOLD OFF control R10 is coupled via diode V9143 to comparator N9161 to give a variable d.c. level (HOLD OFF DC LEVEL) on the output, which is superimposed on the HOLD OFF sawtooth signal. The selected level determines the maximum hold-off by controlling the switching level of D9102-18 (Hold-off logic). The d.c. level shifts the sawtooth upwards so that the hold-off is reduced; i.e. it reached the switching level of flip-flop D9102-18 faster. Consequently, the EOS H.O. goes high and the MTB is then free for another sawtooth sweep as follows:

D9102-18: high, as a result  
 D9102-16: high, D9102-15 } low, -> D9102-14: high  
                   D9102-19 }           D9102-13: low  
                   D9102-20 }           EOS    1: low

In the SINGLE mode, the SR- (SINGLE RESET) input to the base of V9129 is low. This transistor switches on to give a high on EOS H.O. as there is no hold-off required in the SINGLE mode.

TIME/DIV. TABLE

FIG.15.2 Control data from HEF 4094-bus for MTB, Hold off and DTB TIME/DIV. settings.

## 15.2. DELAYED TIME BASE CIRCUIT DESCRIPTION (see fig.15.13)

### DTB trigger input circuit and DTB logic.

The DTB trigger input circuit is similar to that of the MTB.

The positive going DTB trigger current signal is applied via a 50 ohm adaption resistor R9201 to the common-base transistor V9201. The series feedback amplifiers V9372 and V9373 convert the input voltage signal into symmetrical current signals. The gain of this stage is determined by R9375. These current signals are fed to a Schmitt-trigger circuit to sharpen up the edges of the trigger pulse.

This Schmitt-trigger circuit consists of V9374, V9376, V9378 and V9377.

This circuit is biased in such a way that very fast switching is achieved. The output voltage signal is fed via two emitter-followers V9379 and V9202, which functions as a buffer, to the clock input of D-flip flop D9201-1.

#### DTB logic

In the normal situation, the S and R inputs (D9201-23 and 2) are low when a trigger is received and data information (data to earth) is clocked to the Q output; i.e. Q is low, Q- is high. The Q- high output starts the DTB sweep (D9201-12)

The starting conditions are dependent on STM- signal (STARTS ON MAIN), derived from the HEF-bus:

- When this signal is active low, the DTB starts immediately after the MTB.
- When this signal is inactive high, the DTB waits for a DTB trigger.

#### DTB is off

The DTB is switched off as follows:

Input signal DTB OFF coming from the HEF bus is high in this mode and STM- is not effective.

This causes V9206 to conduct, and diodes V9209 and V9208 block. Input D9202-19 is low because of R9218 and the S input of the start flip flop is also low (D9201-23).

Depending on the STM- signal the start flip flop either clocks-in one trigger, when STM- is high (DTB TRIG mode) or is reset, when STM- is low (STARTS DTB mode) and starts the DTB sawtooth generator once (Q-/D9201-12 is high) up to the moment that EOS DET. is high. This EOS DET, signal can not set D9201-18 for another sweep, because diode switch V9208/V9209 is blocked, so the DTB is off.

#### DTB awaiting trigger (TRIG DTB mode)

With STM- high, the lower input of NOR-gate D9202-20 is high.

The DTB is on, so the DTB OFF signal is low. V9206 blocks and diode V9208 conducts because the cathode is low (D9202-12 is low).

D9202-12 is low because both inputs of the NOR gate are low. (MTB EOS 3 is low and D9202-23 is also low after the delay time)

Diode switch V9208 conducts which makes the junction V9208/V9209 low. As a result V9209 blocks and D9202-19 and the S input (D9201-23) are held low by R9218. With D9202-20 high and D9202-19 low, the output (14) is low, so the reset input D9201-2 is also low.

With both the R and S inputs low, after the delay time, the DTB start flip-flop D9201-1-11-12 is therefore awaiting a trigger to clock in the data input. On the arrival of a trigger, the data is clocked to Q (low), which gives the high start output on Q-(D9201-12).

DEFLECTION MODE TABLE

Front-panel modes	HEF-bus signal bits						
	Single	Doff	STM-	AT-	x10	SR-	X DEFL
AUTO	0	x	x	0	x	1	0
TRIG	0	x	x	1	x	1	0
SINGLE	1	x	x	1	x	see *	0
STARTS	x	x	0	x	x	x	x
x10 (X MAGN)	x	x	x	x	1	x	x
X DEFL	x	1	x	x	x	0	1
MTB	x	1	x	x	x	1	0
MTB INTENS	x	0	x	x	x	1	0
MTB INTENS + DTB	x	0	x	x	x	1	0
DTB	x	0	x	x	x	1	0
MTB INTENS delta t	x	0	x	x	x	1	0
MTB INTENS delta t +2 DTB's	x	0	x	x	x	1	0
2 DTB's	x	0	x	x	x	1	0
x= not effective							

\* : signal normally high, becomes low for a moment after operation of SINGLE pushbutton.

DTB starts immediately after selected delay time (STARTS DTB mode)

In the STARTS mode STM- is low, so D9202-20 is also low.

The DTB OFF signal is low, so V9206 blocks.

As previously described diode switch V9208 conducts and V9209 blocks, so D9202-19 and D9201-23 are held low by R9218.

NOR gate output D9202-14 being high (both inputs low). This results in reset input D9201-2 being high and the set input D9201-23 is low. The output Q- of the start flip flop becomes high, so the delayed time base generator is started immediately after the selected delay time.

#### DUAL DTB mode

The first and second delayed time base part are alternately displayed together with the main time base controlled by the DTB comparator, which in turn is controlled by the DTBS signal coming from the OQ 0200 (D5326 on Y signal unit).

After de selected delay or delta t, an active high is fed to the S input of the Schmitt trigger D9201-18 (reset input is low), which is held by the high Q output fed back via resistor R9332. Output Q- is therefore low, which gives a low on input of NOR-gate D9202-23. The other input is low (D9202-24) MTB EOS 3, therefore, the NOR-gate output (pin12) low. This low output causes diode switch V9208 to conduct which makes the junction of V9208/V9209 low. Diode switch V9209 blocks, and the upper input of NOR-gate D9202-19 and the S input of the start flip-flop are held low by the earth on R9218.

Since STM- is low, the lower input of D9202-20 is also low: so the R input of the start flip-flop is high. With S low, and R high, the Q output is low and the Q- is high, which is the condition for starting the DTB

End of sweep The end of the DTB sweep is signalled by a high on the DTB EOS DETect line fed back from R9259, the emitter resistor of V9231. The resulting high condition on the S input of D9201-(3) is held by the high output fed back from Q. This high is also fed to the NOR-gate D9202-(1) to give a low blanking output Z-DTB to the Z control (D9202-7).

At the end of the MTB sweep (MTB EOS3), the R inputs of D9201-17 and 4 are high. The high on input R of D9201-(4) resets this flip-flop and the Q output (pin 7) now goes low. This gives a low on the upper input of NOR-gate D9202-(1). The lower input is now high (9202-2), because MTB EOS 3 is high, which makes the S input of the start flip flop (D9201-23) high via D9202-12 and diode switch V9208/V9209. As a result the Q output D9201-11 is high and D9202-2 is also high which gives a low output level for Z-DTB blanking.

MTB EOS 3 becomes high at the end of the MTB sawtooth . The DTB sawtooth is discharged at this moment (start flip flop is set as described).

This is done at the same time as the MTB sawtooth to prevent interference during the MTB sawtooth (see fig.15.3).

The discharging of the DTB sawtooth is held by the reset of D9201-(4) which is low during the MTB sweep. This results in a low set input level of the start flip flop (D9201-23) via D9202-12 and diode switch V9208/V9209. So the Q- output stays high until the moment that the MTB sawtooth is completed (MTB EOS 3 becomes high).

If the DTB starts for the next sweep, the Q output of D9201-(11) goes low and the lower input of the NOR-gate D9202-(2) gives a high output to unblank the trace during the DTB sweep.

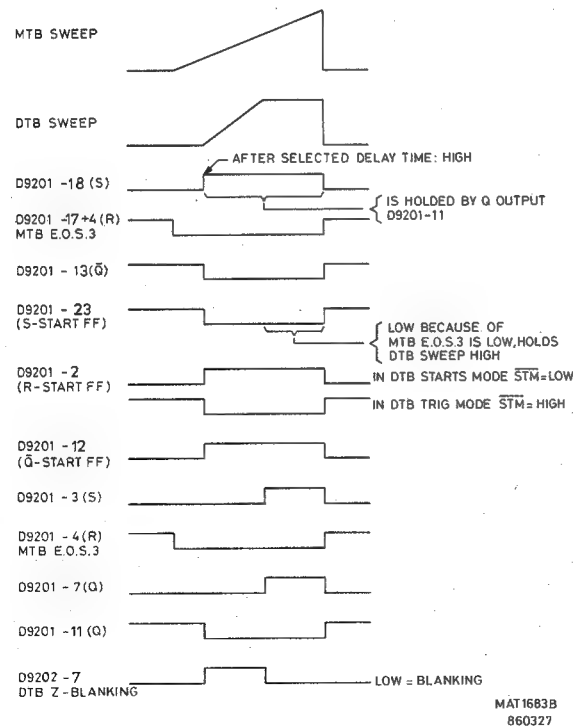

Fig.15.3. Voltage waveforms in the DTB circuits.

### DTB Comparator

The DTB comparator stage compares the MTB sawtooth signal with a d.c. voltage derived from the CPU to give a start signal for the DTB. Two different d.c. levels can be selected. The d.c. level for the DELAY mode can be compared with the MTB sweep for DTB start after the adjusted DELAY TIME, and the delta t d.c. level compared with the MTB sweep for DTB start after DELAY delta t (alternately). The input signals AN0 and AN1 from the microprocessor digital-to-analog converter provide the d.c. levels to the DELAY and delta t potentiometers. Two voltage dividers are provided for each d.c. level; one to adjust the start of the delayed part on the left side of the screen (START) and one to adjust the start of the delayed part on the right side (END), although these are interdependent (see fig.15.4). The resulting d.c. levels are routed via input 3 of the buffer voltage followers N9302 to the comparator; d.c. DELAY to pin 6 and d.c. delta t to pin 4.

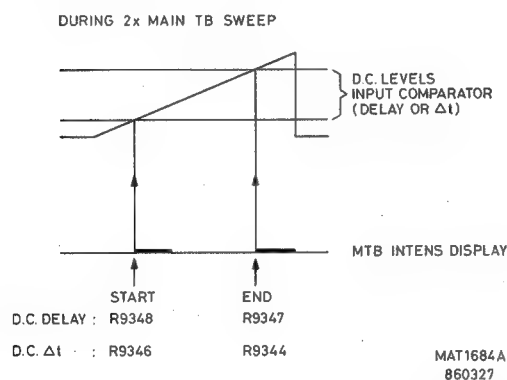

Fig.15.4. Start of the DELAY and delta t sweep at the lefthand side and the righthand side of the screen.

The current sources for the comparator are derived from transistors V9313 and V9312. The base of V9312 is fixed biased by a potential divider; the base of V9313 is controlled by an operational amplifier, which compares and equalises the current sources. This is necessary, because these currents determine the points on which the DTB starts.

The MTB sweep is applied on the bases of the other transistors of the long-tailed pairs that carry the d.c. input voltages. When the MTB sawtooth reaches the selected d.c. DELAY level the comparator draws current from V9306.

When the MTB sawtooth crosses the selected d.c. delta t level the comparator draws current from V9307.

Signal selection is made from the DTBS signal (Delayed Time Base Switch) coming from the OQ 0200 (D5326) on the Y signal unit. The two DTB parts (DELAY and delta t) are alternately displayed (see fig.15.5). The sequence of the selection depends also on the selected vertical display mode (s) (see section 13.3).

When DTBS is high, the DUAL DTB mode is selected. Transistors V9304 and V9308 conduct and V9306 and V9307 block because the emitter of voltage source V9309 is at 8 V. Current is therefore drawn via V9308 from V9318 which means that the delta t trace is visible.

When DTBS is low, the SINGLE DTB mode is selected. Now V9304 and V9308 block and V9306 conducts so the current path is via V9306 and the DELAY trace is visible.

Diodes V9301 and V9302 provide clamping to limit the voltage swing between the DTBS signal input and the bases of V9306 and V9307.

The output transistor V9318 provides an output voltage on its collector which is clamped to ECL level by diodes V9316, V9317 and zener diode V9311. The output gives an active high at the end of the delay time via R9319 to drive the S input of the Schmitt trigger D9201-(18) of the DTB logic.

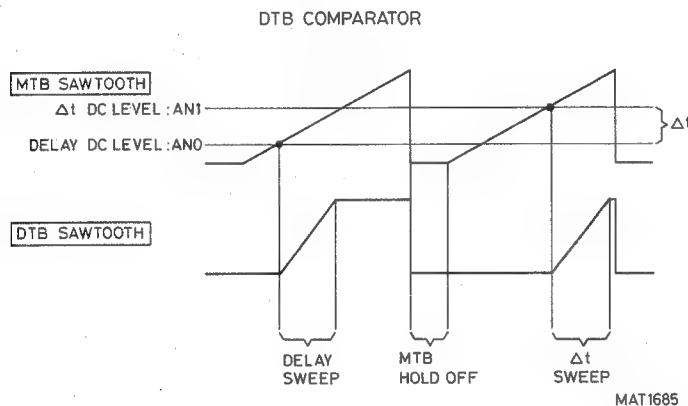

Fig.15.5. DTB display sequence.

#### DTB Sawtooth Generator

The DTB sawtooth generator is similar to that of the MTB. A high signal from the Q- output of the start flip-flop (START DTB on X43) is applied as a current input to the common-base transistor V9211. The resulting collector output is clamped by diodes V9213, V9214 and V9216 and splits into three different paths.

- During the DTB sweep, the high on the base of switching transistor V9218 switches this on, and the low on the collector blocks switching transistor V9219. At the end of the sweep the situation is reversed and V9219 takes over the current from the DTB CURRENT SOURCE.
- During the DTB sweep, the high signal applied to the base of switching transistor V9217 causes this to conduct and the low on its collector blocks switching transistor V9221. At the end of the sweep the situation is reversed and V9221 conducts to provide rapid discharge of the timing capacitors.
- During the DTB sweep, the high signal applied to the base of V9212 switches this on and the low collector output switches off V9236. This gives a high DTB GATE output during sweeps.

The timing capacitors permanently in circuit are C9213 and preset C9216.

Extra capacitors for the slower ranges are:

- C9214 controlled by D2 of the HEF-bus via V9226 }
- C9217 controlled by D3 of the HEF-bus via V9227. } see fig. 15.2

The timing capacitors are charged by the current source via the sawtooth isolation stage V9224.

A double FET, V9237 provides a high-impedance buffer stage and two emitter-followers V9228/V9229 in Darlington configuration provide a low-impedance for the DTB sweep output.

The common-base stage V9232 provides the DTB SWEEP OUT signal, drawing current from the X-PRE-AMPLifier.

Transistor V9238 acts as a current source for the output stage. The other DTB sweep output via emitter-follower V9231 (DTB EOS DET), is fed back to the DTB logic circuits.

#### DTB Current Source

This circuit provides a constant-current source for the charging circuits of the DTB timing capacitors that is dependent on the particular time-base setting and the position of the VAR control. Basically, it consists of range adjustment resistors switched by an analog selector switch to pass a certain current to a six-step resistor level-shifter. This current is applied to an operational amplifier for comparison and gives a voltage reference to the current source amplifier that supplies the constant current for the DTB.

The circuit details are as follows

#### Adjustment points DTB settings

The adjustment range of the presets R9802, R9803, R9804 is determined by the timing capacitor values of the 1 ns, 10 ns and 1 ms ranges.

The analog switch selectors N9806 are energised from the HEF-bus (see fig.15.2) to switch the selected range current to the negative input of level shifter N9801. Preset R9847 for the 10 us range is permanently connected to the negative input of N9801.

The level shifter consists of the operational amplifier N9801 and an accurate six-step load resistor network across a constant supply voltage.

As a result, a current is fed to the operational amplifier and compared to the current at the positive input to give a fixed output voltage. This voltage is taken off by a multiplexer controlled from the HEF-bus (00, 01, 02, see fig.15.2) to give the range CAL voltage ( $U_{CALDTB}$ ) on test-point X29.

In the CAL position (VAR control clockwise) the  $U_{CALDTB}$  has six voltage steps for the time base positions x1, x2, x5, x10, x20, x50. However, in the UNCAL position of the VAR DTB control R8, current is drawn from the level shifter negative input, which means that the  $U_{CALDTB}$  at the multiplexer output is reduced to cover the gap between steps depending on the setting of the VAR control.

This operates as follows. When the VAR control R8 is increased, N9801-3 input goes high and consequently the high output on N9801-1 causes V9801 to conduct and draws current from the six step resistor network.

This produces a corresponding reduction in the  $U_{CALDTB}$ . To prevent errors in the CAL position of R8 (which is not mechanically switched), a pre-voltage of +100 mV on the emitter of V9801 gives a dead angle for the potentiometer.

The  $U_{CALDTB}$  on X29 is applied to the actual current source stage, consisting of operational amplifier comparator N9802 and transistor V9816.

The current source is derived from the +18 V on this comparator (pin 7), the  $U_{CALDTB}$  giving a fixed output on N9802-6 to drive the current transistor V9816.

The  $U_{CALDTB}$  is proportional to the time-base settings; e.g. the lower the current  $I_{DTB}$  to the DTB sawtooth generator (emitter of V9224), the lower the DTB sawtooth speed.

In the x100 position a high logic signal from the HEF-bus (D100) switches on the reed relay K9804 via V9819 to switch R9829 in parallel with R9828 in the emitter circuit of V9816. A reed relay is used to reduce errors that would otherwise be caused by any contact resistance. In this way the current  $I_{DTB}$  is 100 times increased.

### 15.3. CIRCUIT DESCRIPTION OF HORIZONTAL LOGIC, Z LOGIC AND INTENSITY CIRCUIT (See fig. 15.14)

The Z-logic circuits for the DTB are similar to those for the MTB, except that opposite logic polarity is used. Therefore only the Z-logic in MTB mode is described.

The logic is selected by the TBS signal from X9001-11 (the OQ 0200); MTB ON is high, DTB ON is low.

#### Horizontal switch logic - MTB ON

Input 13 of NOR-gate D9401 is high, so output 11 is low. The output is TTL adapted to ECL for the time-base chip print by level adaptors V9411, V9403 with diode clamps V9401...V9412. The low output is applied to NOR-gate input 5. The other input (6) is also low because the X deflection is off. Therefore, output D9401-4 is high. This TBS M signal is applied via R9502 to the base of V9501 (HORIZONTAL SWITCH). This high input blocks V9501 so that current is drawn from the X PRE-AMPL via diode V9502 by the MTB.

Considering the DTB position:

input 8 of NOR-gate D9401 is high and input 9 is low (X DEFL. off) so output 10 is low. Therefore the DTB horizontal switch V9233 conducts and diode V9503 blocks. The sawtooth on the DTB is thus fed to earth; i.e. not to the horizontal amplifier.

The X DEFL. input from the HEF-bus to the horizontal switch is normally low (X DEFL. off), so V9539 conducts and earths the X-DEFL signal present on the collector of V9533, derived from the Y signal unit via X9501. Diode V9504 is blocked.

#### Z-logic

The horizontal switch logic is also fed to the Z circuit. The function of the Z circuit is to provide the logic for switching the intensity regulation circuit, depending on which time-base functions are operating.

MTB on only: (condition-V9414 and V9418 base low)

The high via R9402 is applied to one input of AND-gate D9402-(9). The other input is also high during the MTB sweep (Z MTB) so via the output, the high is fed to input 4 of the MTB NOR-gate D9403 to give a low output to the base of V9414.

The D OFF signal from the HEF-bus is high via R9404 to AND-gate D9402-13 so the input 13 of the DTB NOR-gate D9403 is high. With one input (pin 13) high the output (pin 14) of D9403 is low. So the base of V9418 is also low. Both transistors, V9414 and V9418 are blocked. Equal currents are drawn from the Z amplifier via V9416 and V9417 by the current sources V9422 and V9421.

When DTB on only : (condition - V9414 base low, V9418 base low)

The low on input 13 of D9401 gives a high on output 11 because input 12 is also low. This high is fed via R9403 to give a high on the input 4 of AND-gate D9402. During the DTB sweep the other input (5) is high (Z DTB), so the output (2) is high, which gives a high input to the MTB NOR-gate D9403(6) to give a low output to the base of V9414 (this V9414 is blocked).

Input 12 of the DTB NOR-gate D9403 is low because the X-DEFL is low. The low Z MTB is applied to input 12 of AND-gate D9402, the output (15) of which gives a low to the input 13 of the DTB NOR-gate D9403. Finally, the low D OFF input gives a high output on D9401-3, which in turn gives a high input 6 of AND-gate D9402. This results in a high to input 11 of the DTB NOR-gate D9403. The output to the base of V9418 is low. V9418 blocks, as a result V9417 conducts. Both transistors, V9414 and V9418 are blocked. Equal currents are drawn from the Z amplifier via V9416 and V9417 by the current sources V9422 and V9421.

MTB Intens mode:

Input signal TBS (Time Base Switch) is high during the MTB part and low during the DTB part (intensified part).

In MTB INTENS mode the intensity of the MTB part is reduced (see fig. 15.6) and the DTB part has normal intensity. The logic levels in this mode are given in fig.15.7.

At the moment that the MTB is on, Z MTB is high and Z DTB is low. The inputs of AND-gate D9402-(10 and 9) are high. This gives a high output (14) which is fed to input 4 of MTB NOR-gate D9403. Therefore a low output is supplied to the base of V9414 (X52).

With Z DTB low and D OFF low and Z MTB high all inputs of D9403 (12-9-13-11-10) are low. This results in a low output 15 and a high output 14. This high output is fed to the base of V9418. So V9418 conducts and V9417 blocks. In this way the intensity of the MTB part is reduced.

Fig.15.6. Voltage waveforms in Z logic in MTB INTENSified mode.

### Intensity Reduction Circuit

Intensity reduction is achieved by two transistor stages that are separately switched from the HEF-bus to adapt the voltage range of the INTENS potentiometer to the various time-base settings.

Fig.15.7. Logic levels in INTENSITY control circuit.

The INTENS control R14 is connected between 0 V and +13.8 V. The slider is connected via R9637 to the high-impedance positive input of buffer N9601, which provides a low-impedance output to the Z intensity regulation circuit. The INTENS control is also connected to two diode switching circuits that can influence the intensity range as shown in fig.15.8 The logic levels of the control signals Z1 and Z2 are given in Fig.15.7.

These circuits operate as follows:

- With the base control HEF-bus signals Z1 and Z2 off (logic low), transistors V9613 and V9614 are off and diodes V9617, V9616 are blocked. Consequently, the full range of the INTENS control is applied to the Z INTENS circuit.
- If Z1 signal is high V9613 conducts and if the INTENS voltage from R14 is higher than  $1,17 + 0,6 = \approx 1,8V$  then diode V9617 conducts and reduces the intensity range as shown, via the input buffer.
- If Z2 signal is high, V9614 conducts and if the INTENS voltage from R14 is higher than  $3,8 + 0,6 = \approx 4,4V$  then diode V9616 conducts and reduces the intensity range as shown, via the input buffer.

Fig.15.8. Graph of range of INTENSITY control circuit as a function of the HEF 4094 bus signals Z1 and Z2.

### INTENS Regulation Circuit

The main function of the intensity regulation circuit is to draw different currents from the Z pre-amplifier according to the different trace requirements.

The circuit basically comprises two switching transistor pairs, V9414/V9416 and V9418/V9417 and two current sources V9422 and V9421. The bias voltages of the current sources are controlled by zener diodes V9423 and V9419.

The current drawn from the Z pre-amplifier normally increases with increased INTENS control setting.

When the MTB mode is chosen, inputs to both V9414 and V9418 are low and normal regulation takes place linearly from the INTENS control (see level b of fig.15.9) In this event, both current sources draw current from the Z pre-amplifier via V9416 and V9417. When MTB INTENS is selected the intensified part (DTB) has normal intensity (as in MTB only mode) and both current sources drawn current from the Z-preamplifier. The MTB part intensity is reduced by subtracting the current from the current source V9421 (X53 is high, V9418 conducts) from the total current (see level a of fig.15.9)

Fig.15.9. Graph of range of INTENSity control circuit.

In MTB INTENS mode switching alternates between the a and b levels (b level for the DTB and a level for MTB part).

Summarising, during the MTB and DTB sweep, the low on the base of V9414 switches this transistor off and V9416 is switched on. Current is drawn by V9422 via V9416 from the Z PRE-amplifier.

### Stabilisation Circuit

The selected sawtooth current signal is fed from the horizontal switch stages via diode switches V9502, V9503, or V9504 to the emitter of common-base transistor V9506. The collector supply of this transistor is voltage stabilised by a feedback operational amplifier N9708 and capacitive filters to prevent interference. The resulting voltage waveform at the collector of V9506 is a sawtooth with an amplitude between +1 V and +4 V. This is applied to the base of emitter-follower V9507 to provide a low-impedance output to the X-pre-amplifier.

### X Pre-amplifier

The X POS control provides an input that can be varied between 0 V and +10 V. The slider potential is connected via a low-pass RC filter to the base of emitter-follower V9508.

The X pre-amplifier proper consists of three series feedback amplifiers (Cherry stages), V9509/V9511, V9512/V9513, V9514/V9516, which can be separately selected by switching their emitter stages. These stages carry the separate GAIN presets for the x10, x1 and X-DEFL. In the X-DEFL stage the resistors R9527 and R9526 provide that the spot (in X-DEFL mode) is in the center of the screen. Active high signals from the HEF-bus switch the x10 and X-DEFL. amplifiers via V9522 and V9524 respectively.

The x1 stage is switched via V9523 when the x10 and X-DEFL. input signals are low.

The current source (10 mA), always switched to one of these stages, is V9528, which gives the  $U_{REF}$  on the common emitter circuit of the switching transistors.

### X Signal-Text Switch

The asymmetrical sawtooth is fed to the X signal-text switch, controlled by EO- signal from the Y Signal Unit. As its name implies, this stage selects either the X signal or the text to feed the Final X Amplifier.

Basically, it consists of a long-tailed pair, V9537/V9538, coupled by two pnp transistors V9527 and V9526 to a diode switching network.

X signal : with EO- low, V9537 is switched off. The corresponding high on its collector is applied to the base of pnp transistor V9527 to switch it off. The low on the collector causes diodes V9534 and V9531 to block; i.e. they do not short-circuit the X signal, which is fed via diodes V9536 and V9532 to the Final X Amplifier.

With V9537 off, V9538 conducts and its collector goes low. This is applied to the base of pnp transistor V9526, which also conducts. The high on its collector causes diodes V9518 and V9519 to conduct which shorts out the TEXT input. Diodes V9517 and V9521 are blocked.

TEXT : with EO- high, V9537 is switched on and its collector is low. The pnp transistor V9527 conducts and the high on its collector causes diodes V9534 and V9531 to conduct, which short-circuits the X signal and blocks the path via diodes V9536 and V9532.

With V9537 on, V9538 switches off and its collector goes high. This is applied to the base of V9526 which blocks. The low on its collector blocks diodes V9518 and V9519 ; i.e. they do not short-circuit the TEXT input, which is now routed via diodes V9517 and V9521 to the Final X Amplifier.

### Time-base supply voltages

The +25 V input from the secondary converter is fed via R9727 to a zener diode V9709. This diode, with smoothing capacitor C9704 across it, provides the 18 V supply for the operational amplifiers of the current sources.

The 25 V input also supplies a voltage regulator N9602 for the 5.15 V reference voltage (UREF). Preset R9623 provides an adjustment for the UREF.

In turn, UREF is applied to three voltage regulators with outputs of +12 V, -12 V and +15 V.

The regulator circuits are identical, and therefore only the +12 V circuit is described.

It consists of an operational amplifier N9601 with a zener diode V9603 in the output to keep the regulator voltage within the 10 V working range of N9601. The output from the zener diode feeds the base of the emitter-follower V9601. The feedback voltage (5.15 V) from the junction of the output resistors R9604, R9606 is applied to the negative input of the operational amplifier to control the output voltage. Transistor V9602 provides short-circuit current protection for the base-emitter junction of the output transistor V9601.

The +15 V voltage regulator circuit is fitted with a larger zener diode (V9608 = 12 V) to drop the extra regulation voltage. The three voltage outputs can be checked on test-points:

X31 = + 12 V  
X32 = - 12 V  
X33 = + 15 V

16. CIRCUIT DESCRIPTION OF FINAL X/Z AMPLIFIER.16.1. CIRCUIT DESCRIPTION OF INTENSITY AND FOCUSING (See fig.16.2.)Z Amplifier

The Z amplifier consists of a text intensity pre-amplifier circuit in which the TEXT intensity signal from the TEXT Unit is controlled by the READ OUT potentiometer and passed to a Z pre-amplifier stage. This is the input stage for the Z signal from the time-base Z-logic and the Y CHOP blanking signal, and also an input for EXT Z modulation. The TEXT and Z signals are then routed to a switch selector stage, where the selected signal is then split between a focus amplifier and the final Z amplifier. The latter uses a modulator circuit to isolate the output (for d.c. and l.f. signals) from the very high c.r.t. potentials. This circuit is capacitively coupled to the c.r.t., the d.c. and low-frequency components of the signal being modulated for coupling purposes and then d.c. restored by a demodulator on the CRT Socket.

Text input circuit and Z Pre-amplifier

The TEXT signal from the TEXT Unit (CTU) is applied to pin 9 of D5801 at TTL level (0.8 V = L, 2.4 V = H).

A high on pin 9 is applied to the base of one transistor of a long-tailed pair. This transistor switches on and the output transistor switches off. The high on its collector means that no current is drawn from R5858 (blanking). Conversely, a low on pin 9 switches off the input transistor and switches on the output transistor. The low on the collector (pin 6) means that current is drawn from R5858 (4 mA max.), which is the unblanking condition. This current is influenced by the position of the READ OUT (TEXT + CURSOR INTENSITY) control, which is applied on pin 14 via an emitter-follower to a transistor in the common-emitters of the long-tailed pair.

The TEXT output current via R5858 is applied to the emitter of common-base transistor V5851 and fed to the selector switch diode V5857. The 0 and 4 mA Z signals and the CHOP blanking signals are also fed to a common-base transistor, V5852. In addition, the EXT Z-MOD input is routed via a long-tailed pair V5861/V5862 to the emitter of V5852. External blanking is achieved by a high input, unblanking by a low input. Transistor V5862 therefore draws less current at blanking. The Z signal on the collector of V5852 is fed to the selector switch diode V5856. The biasing of the transistors V5851 and V5852 is stabilised via operational amplifier N5803.

Selection between Text and Z signals

Z selection is determined by a signal from the CTU fed to the base of transistor V5858 of long-tailed pair V5858/V5859. The Z signal is low for selecting the time-base Z signal and high for the TEXT Z-signal.

When selecting time-base Z, the low input switches off V5858 and high on its collector switches on V5853. This short-circuits the TEXT Z-signal path and blocks diode V5857.

With V5858 off, V5859 is on and the low on its collector switches off V5854. This allows the Z signal to flow via diode V5856 to the emitter of V5618.

When selecting TEXT-Z, the high input switches on V5858 and the low on its collector switches off V5853. The TEXT input is no longer short-circuited but flows via diode V5857 to the emitter of V5618. With V5858 on, V5859 is off and its high collector switches on V5854, which short-circuits the time-base Z signal and blocks V5856.

The current output from the common-base stage V5618 gives a voltage level across R5633, R5634, R5636, which is applied to active transistor V5619 of a long-tailed pair current-source, V5619/V5621. This supplies two similar voltage feedback amplifiers. Current is drawn either from the focus amplifier or from the final Z-amplifier.

#### Focus amplifier

Current is drawn by the cascode amplifier configuration V5629/V5631, used to speed-up the signal waveform. The additional emitter-follower V5623 is included for feedback. Bandwidth compensation is achieved by trimmers C5616 and C5618 in the feedback circuit. Positive slope speed-up is given by V5622, which draws current from the emitter of the current source V5624. The diodes V5626, V5627, V5628 reduce recovery time when V5624 is overloaded. The class B final amplifier consists of complementary pair V5632/V5633. The FOCUS OUT to the CRT Socket is taken from the mid-point of emitter resistors R5654, R5656. The test-point X27 is capacitively coupled to avoid loading the amplifier output. The gain of the focus amplifier is 0.74, which is smaller than that of the Z amplifier.

#### Final Z-amplifier

Current is drawn from the input transistor V5621 by the speed-up cascode circuit V5636/V5637. The extra emitter-follower V5638 is included for constant feedback. Capacitors C5627 and C5628 provide for bandwidth adjustment.

Positive slope speed-up is achieved by the a.c. coupled transistor V5647, which draws current from the emitter of V5642. This gives fast switch-off of the cascode circuit. The diodes V5643, V5644, V5646 reduce the recovery time when current-source V5642 is overloaded. The class B final amplifier stage consists of complementary pair V5639/V5641. The Z OUT (the AC path) is taken from the mid-point of emitter resistors R5679, R5681.

The test-point X28 is capacitively coupled to avoid loading the amplifier output.

Common-base transistor V5648 provides a constant load. Its collector is connected via a high-frequency filter C5637, R5687 to provide the l.f. and d.c. path. The pnp transistor V5651 and its associated components form the oscillator. The modulator consists of a oscillator with a frequency of 100 kHz for modulating the d.c. and l.f. signals. These signals are supplied via the emitter of V5652 of the cascode circuit V5652, V5657, which is capable of responding to fast high-voltage signals. The modulated output is fed via V5657 to the class B amplifier stage V5654 and V5656. The common emitter point feeds the 100 kHz modulated d.c. and l.f. signal to the CRT Socket. Preset R5696 allows for an output variation (-75 V...-125 V) for CRT-tolerance compensation.

## 16.2. CIRCUIT DESCRIPTION OF X AMPLIFIER AND CRT TEXT PART (See fig.16.3)

The selected inputs from the X pre-amplifier are fed as current waveforms via 50-ohm adaptation resistors to the balanced common-base circuit V5802 and V5803. The collector outputs are coupled to the transistors V5711, V5707 and V5719, V5714 in cascode configuration for signal speed-up.

Diodes V5709 and V5712 reduce the voltage levels during the negative signal slopes to prevent damage to the cascode transistors.

The voltages present at the outputs of the X-amplifier are taken off via voltage dividers R5701/R5730 and R5724/R5730 and are common mode compared with a voltage  $a$  at the astigmatism electrodes of the CRT. This comparison is achieved via operational amplifier N5803/5, 6, 7. During the time that text is written (signal OEN active and low via electronic switch D5802) is LF and DC drift compensated via the circuitry around the operational amplifiers N5801 and N5802. Comparison of input and output signals is achieved via respectively R5803/R5807/R5806/R5804 and the feedback loops R5702/R5703/R5704 and R5711/R5712/R5716 and comparator N5801. N5802 functions as a 180 degree phase shifter that supplies both halves of the X-amplifier.

Transistors V5704 and V5717 are current sources supplied by the +120 V and -120 V lines respectively, controlled via zener diodes V5706 and V5718 to ensure a fast positive slope.

Voltage feedback is via emitter-followers V5703 and V5716.

The output signal levels from the cascode amplifiers are +60 V and -60 V. These are level-adapted, the +60 V to +12 V by 47 V zener diode V5708, and the -60 V also to +12 V by 68 V zener diode V5719.

#### Text X-Y and cursor circuit

This circuit converts the digital TEXT X-Y and CURSOR information into analog signals for the time base and final Y amplifier.

Signal X- (coming from the CTU) is low to start the X sweep by switching V5762 off. Timing capacitor C5757 charges linearly, drawing current from the X sweep current source V5759. The X amplitude is adjustable by preset R5758 (AMPL X). The X sweep sawtooth takes care of the horizontal tracing of the text and is faster than the Y sweep. The X sweep is fed to multiplexers D5602 and D5603. These multiplexers are selection switches, controlled by three input signals SEL0, SEL1 and SEL2 coming from the CTU unit.

Similarly, the Y-(coming from the CTU) signal is low to start the Y sweep by switchin V5763 off. Timing capacitor C5758 charges linearly via current source V5761 with its preset adjustment R5762 (AMPL Y). The Y sweep sawtooth (asymmetrical) takes care of the vertical tracing of the text. This is fed to multiplexer D5603. The other two inputs are d.c. levels AN0 and AN1 (0 to 10 V d.c.), which determine the position of the cursors on the screen. Both these are routed via voltage dividers to give 0 to 4.5 V to inputs on both multiplexers. In addition, the delta CURSOR input (AN1) has a preset, R5773, to compensate for resistor tolerances and to equalize the position of the cursors on the screen.

The selected multiplexer outputs provide a symmetrical current output for the time-base and an asymmetrical current output for the final Y amplifier.

Transistor V5769 acts as a voltage to current converter to control the time-base.

When the output of multiplexer D5602(3) is low, the low on the comparator output blocks V5769 and V5771 conducts and draws current. The ZERO ADJ. control R5779 and operational amplifier N5602 achieve symmetrical output to the time-base.

The gain preset R5784 is a balance control.

The output voltage of multiplexer D5603 is fed to test-point X46 on the positive input of comparator N5601.

When the output on the multiplexer is high, the high on the comparator output causes V5774 of long-tailed pair V5773/V5774 to conduct and draw current from the final Y amplifier via X5626.

The current source is V5776 in its emitter circuit, the  $U_{REF}$  being derived from the voltage source V5767 as before. With V5774 conducting, V5773 is blocked and no current is drawn from the final Y amplifier via the other output socket X5622. When the D5603 multiplexer output is low, V5774 blocks and V5773 conducts, current being drawn from the Final Y amplifier via X5622.

# 17. CIRCUIT DESCRIPTION OF CRT SOCKET (See fig.17.2)

The CRT socket stage consists of the various circuit networks that are connected with the base of the c.r.t.

The circuit networks are the demodulators for the Z signal and focus signal.

The modulated d.c. and l.f. signal from the modulator circuit on the X-Z unit is applied on X8401-5 and forms two paths via R8414 and R8416. The Z demodulator path is via R8414 and the high-voltage blocking capacitor C8404. The Z signal is demodulated by a positive peak-peak detector consisting of diodes V8404, V8406 and C8406, R8407, R8404. The output consists of the d.c. and l.f. components of the Z signal superimposed on the -2,2 kV. The AC (Z) path is also added via R8401 and the high-voltage blocking capacitor C8401, to feed the c.r.t. control grid G1.

The zener diode V8401, Darlington pair V8402, V8403 and the resistance chain R8408, R8409, R8411, R8412 forms a 148 V zener circuit which provides the voltage difference between the K and G1 electrodes of the c.r.t. This bias voltage ensures blanking when there is no input signal.

Resistor R8403 maintains the filament at the same potential as the cathode.

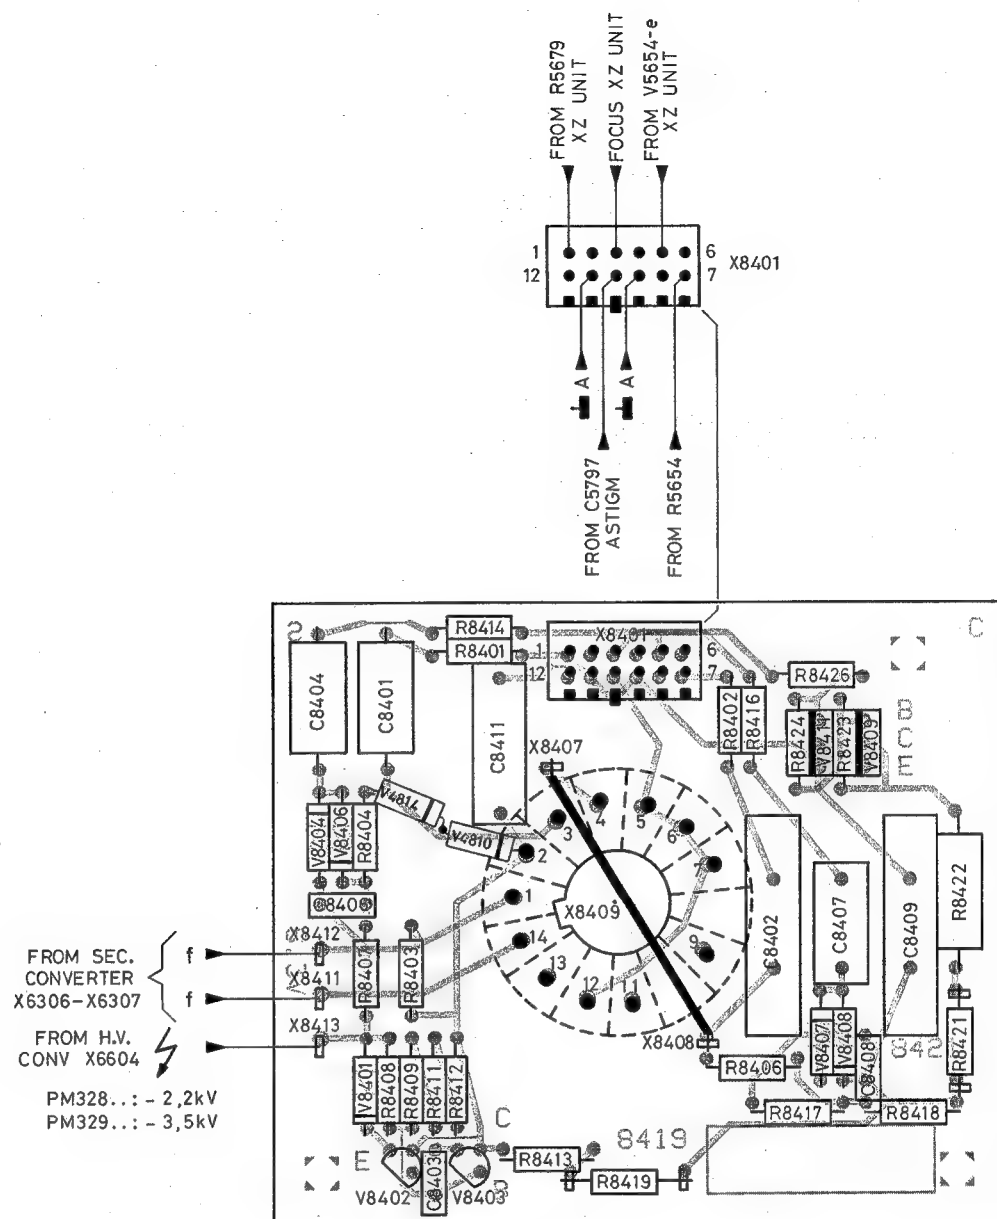

The negative demodulation for focus control is via R8416 and the high-voltage blocking capacitor C8407. The Z signal is demodulated by a negative peak-peak detector V8407, V8408, C8408 with voltage divider R8417, R8418, and R8406. The d.c. and l.f. focus signal is recombined with the AC focus signal to feed the c.r.t. focus electrode G3. The AC focus signal is routed via h.f. blocking capacitor C8402.

This AC signal represents the dynamic focus signal which gives automatic adjustment of the level in the MTB INTENS mode. However, the static level is determined by the potential divider (R8413, R8419, R8421) from the -2,05 kV supply and the position of the manual FOCUS control potentiometer (R13).

The input on X8401-3 from the FOCUS control (static focus) is applied via R8426 to the base of V8411 to vary the current through the resistor chain in the collector of V8409.

With the FOCUS control at minimum (0 V) the transistors conduct and the collector voltage level on V8409 is -33 V.

With the FOCUS control at maximum (+13.8 V) the transistors block and V8409 collector stands at -400 V. However, the 75 V focus range from the negative focus demodulator (V8408-C) does not change. Resistors R8419 and R8421 are selected to compensate for c.r.t. tolerances (setting the -1,6 kV level).

# 18. CIRCUIT DESCRIPTION OF PRIMARY CONVERTER UNIT (See fig.18.4.)

**WARNING :** The complete circuit is at mains potential up to transformer T6201.

The block diagram, Fig.18.1, shows the connections of the primary converter within the power supply. In order to produce the 48V supply for the secondary converter, two identical standard 24 V units are used with outputs series-connected; primary converter I and primary converter II.

Each primary converter basically consists of:

- a mains filter and bridge rectifier circuit
- a forward converter (moulded part)
- a secondary rectifier circuit with over voltage protection.

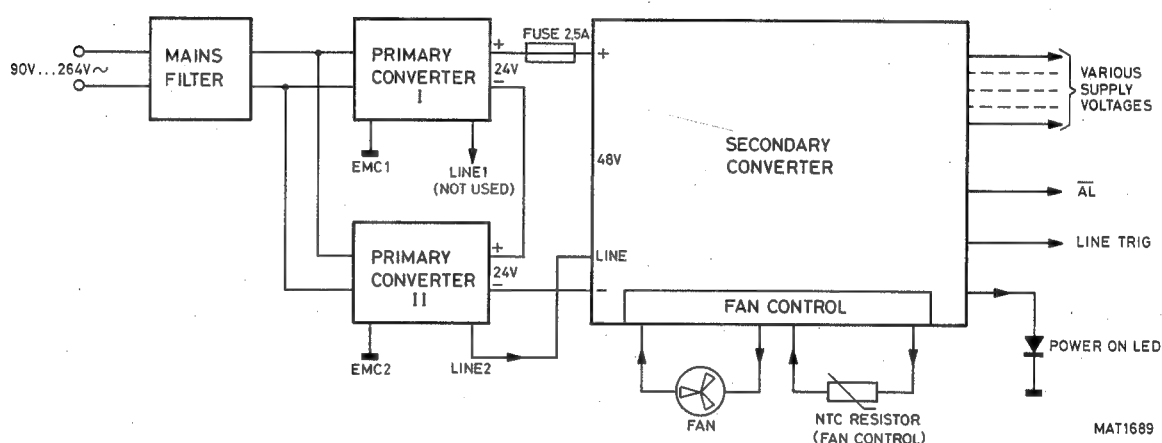

Fig.18.1. Interconnections of primary converters.

## The mains filter and bridge recifier

The mains input (90 V...264 V ac) from the mains socket with filter and routed via double-pole switch S65, fuse F1 to connections X6204 and X6202. Resistor R6201 has a surge current limiting function. Capacitor C6201 across the input acts as an interference limiter.

At this point, the X6201 and X6203 connectors of the primary converters are paralleled with the X6202 and X6204 connectors. A capacitive network C6202 ... C6209 across the input serves to reduce interference, the centre-point being coupled to earth to provide electromagnetic compatibility (EMC1).

In the primary converter II the other half of the capacitive network (C6206, R6203) is used as a trigger pick-off point for LINE triggering. The full-wave diode bridge V6201 ... V6204 rectifies the input voltage, which is fed to forward converter.

### The forward converter

Since the forward converter is a moulded part of the unit, the components are not accessible. Therefore, only a brief description of its operation is given.

The d.c. input from the bridge rectifier is smoothed in C6211, L6203, C6212 and C6213. To limit power surges at start-up, the base current ( $I_b$ ) for V6222 of the converter Darlington circuit V6222/V6223 is initially blocked via the series diodes V6206, V6207, V6208, and  $I_b$  is only supplied via the limiting resistor R6213.

However, after start-up, V6206 ... V6208 conduct and constant base current is supplied via R6211, regulated by V6211. The constant base current is stabilized by the network R6211, C6217, V6218, V6219, V6221 and V6234. Zener diode V6212 provides a constant 7.5 V level on the base of series regulator V6211. This network, together with diode V6209 provides a voltage stabiliser to give 6.9 V on the emitter of V6211 independent of the mains voltage. In turn, this gives a constant base current via R6209, R6211 to V6222 as shown in fig.18.2.A. As a result, V6223 conducts and its collector current  $I_c$  increases linearly as shown in fig.18.2.B. This increase continues until the control voltage from the feedback winding (9 turns) (equal to the secondary voltage), rectified and stabilised by V6217, V6233 and V6216, is sufficient to fire thyristor V6213, which blocks the series regulator V6211.

The output feedback voltage across V6214 determines the converter frequency (20 kHz approx.);  $-0.5\text{ V} \dots +0.6\text{ V}$  gives an  $I_c$  of 0 A ... 2.2 A.

The NTC resistor R6214 gives temperature compensation for the thyristor V6213.

At high mains voltages, power limiting is achieved during the forward stroke by resistor R6207.

The maximum  $I_c$  of V6223 is also regulated by the current measuring resistors R6216 and R6217.

Capacitor C6217 charges during the forward stroke and provides a negative-voltage source for fast switch-off of V6222-V6223.

Chokes L6207, L6208 in series with the primary windings of T6201 saturate (low-reactance) during normal operation, but have considerable reactance at start-up, thus limiting peak currents. Snubbing circuits C6219, V6224, V6226; C6221, V6227 and the coil (8t), protect the Darlington transistors V6222/V6223 against fast positive peaks at the moment that they are switched-off.

During the forward stroke energy is build-up in the converter transformer T6201.

During the fly-back stroke this energy is discharged via the secondary winding over the secondary rectifier circuit.

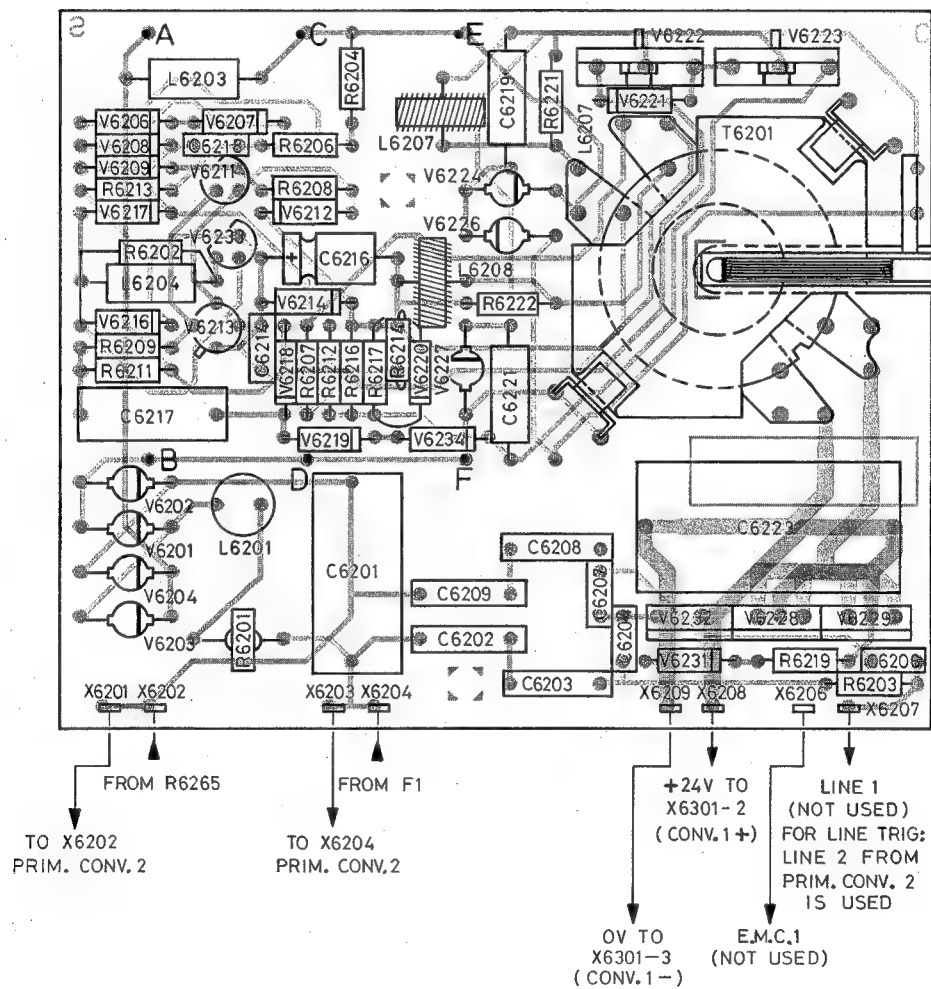

Fig.18.2. Waveforms in primary converter.

#### Secondary rectifier circuit

The current in the secondary winding of T6201 during the flyback stroke of the converter i.e. when V6223 blocks, decreases linearly as shown in fig.18.2.C. The current is half-wave rectified by diodes V6228, V6229 and smoothed by C6223. The flywheel diode V6232 prevents inverse currents appearing in the secondary winding.

Overvoltage protection is provided by zener diode V6231 in series with R6219 across the secondary output.

The secondary outputs of primary converter I and primary converter II are series connected to give a smoothed 48 V to the secondary converter unit.

# 19. CIRCUIT DESCRIPTION OF SECONDARY CONVERTER UNIT (See fig.19.5)

The secondary converter is similar in principle to the primary converter. It basically consists of:

- a flyback converter circuit
- a voltage regulator
- a control circuit
- a line trigger circuit
- a fan control circuit.

## The flyback converter (V6306, V6342)

The flyback converter consists of transistors V6306 and V6342 and their associated components. The normal converter frequency is  $\approx 25$  kHz. For waveforms, see fig. 19.1.

Transistor V6342 conducts on the forward stroke and charges transformer T6301. The thyristor V6303 fires when the current measuring resistor R6309 has approximately 0.57 V across it. Consequently, V6342 blocks (FET V6306 blocks) for the duration of the flyback stroke, during which the secondary windings discharge via the diode rectifiers into the smoothing capacitors.

The NTC resistor R6301 provides temperature compensation for the firing point of the thyristor. The zener diode V6341 gives over-voltage protection to prevent the cathode gate voltage of the thyristor exceeding 15.5 V.

The waveforms present on the gate (X29) and the drain (X28) of the FET V6306 and over R6309 (X27) are given in fig.19.1.

The CON-signal (X32) is according the output of comparator D6302-6-7-1 (open collector output) under normal conditions constantly high (27 V), but at the moment that the thyristor V6303 fires (every 40  $\mu$ s) this level is low for 4  $\mu$ s.

Fig.19.1. Voltage waveforms in the flyback converter.

### Voltage regulator circuit (D6301)

The voltage regulator uses an integrated circuit D6301 to ensure a very constant output voltage.

The 5 V U REF voltage from the control circuit is applied to the positive input (pin 5) of a unity gain operational amplifier D6301 and provides the reference input (pin 2) for the comparator D6301. The other input is a +5 V feedback voltage from the rectified secondary of T6301. The resulting output voltage on pin 1 of D6301 is used to control the primary current through T6301. Its value is greater than 0.7 V, typically 1.5 V, and has a maximum of 12 V. If this voltage is negative, the converter is overloaded. The voltage is applied via diode V6309 as the control voltage (CONTR) to the cathode gate of the thyristor V6303.

If the +5 V feedback voltage is for instance too high, D6301-3 gets higher and D6301-1 will be higher than 1.5 V. As a result the thyristor V6303 will fire earlier (faster). This means that the forward stroke gets shorter, so the converter transformer T6301 will be less charged and the output voltages will decrease.

### Control circuit (D6302)

The control supply voltages are derived from the +50 V [PRIM] supply. Fed via the two parallel resistors R6314, R6316, zener diode V6311 provides a +27 V for comparators D6302. Likewise, zener diode V6312 gives an output to a voltage divider that is adjustable by R6318 to give a 5 V U REF output on test-point X30.

The 5 V U REF output is also fed to input 10 of comparator D6302 where it is compared with a sampled potential on input 11, obtained from voltage divider R6323, R6324 across the +50 V [PRIM] supply. The circuit detects whether the supply is too low. A temperature compensation stage, V6339 controlled by a PTC resistor R6308 in its base circuit is also connected to input 11. At temperatures higher than 80 degrees C V6339 conducts and reduces the potential on input 11 of the comparator.

Therefore, if the 50 V [PRIM] input is low, or the circuit temperature is greater than 80 degrees C, output 13 of D6302 goes low, C6313 discharges in 50 us and output 2 of D6302 goes low (AL-). This alarm signal is routed to output connector X6302-32.

The low output from C6313 is also applied to the lower comparator in input 7. Since input 6 is at a lower potential than input 4 there is a delay of 1.5 ms after which the output on pin 1 goes low and switches off the converter by the low on the anode gate of the thyristor V6303 (CON: converter on signal).

The alarm signal AL-, routed via the motherboard to the CPU unit, thus saves the memory contents of the uP before the power is off.

At switch-on, AL- becomes high after 150 ms (the starting-up time determined by the charging time of C6313)

### Line trigger circuit

The LINE 2 input from primary converter 2 is a mains-voltage related signal. To ensure that the line trigger signal has constant amplitude this circuit provides automatic gain control. The LINE 2 input is fed to a feedback operational amplifier D6301 with a gain of 1000 (R6341/R6339). The output on pin 14 is fed to a comparator input D6301-10. The other input carries the 5 V U REF. This stage operates as a top detector. The output on pin 8 is a rectangular waveform

(+14V ... -14 V) the pulse width being dependent on the amplitude of the sinewave input D6301-10 (see also fig.19.2). These pulses are rectified by diode V6313 and charge capacitor C6316 to give a negative control voltage on the base of FET V6314. This FET conducts to regulate the amplitude of the LINE 2 signal. If, for instance, the mains voltage increases, LINE 2 also increases. Then output D6301-14 also increases. As a result the pulse width of the square wave signal on D6301-8 will get wider (see fig.19.2). FET V6314 will conduct more, which decreases the sine wave signal on D6301-12. This results in a direct correction of the output sine wave on D6301-14. The output on D6301-14 provides the constant LINE TRIG signal on X34 (0.24 V eff), which is routed via the motherboard to the adaptation unit.

Fig.19.2. Voltage waveforms in the line trigger circuit.

#### Fan-control circuit

This consists of a highly-efficient switched series-regulator for determining the supply voltage to the fan, controlled by an NTC resistor on the Mother Board.

The sensing input NTC-1 is applied to the comparator positive input D6302-9. A  $U_{REF}$  of 5.1 V derived from zener diode V6329 is applied to input D6302-8 together with the switch hysteresis input via R6351. For waveforms, see fig.19.3.

With input D6302-9 low (high temperature) output D6302-14 is low, which gives a low switch signal via zener diode V6332 to the base of the pnp series-regulator V6331. This conducts to provide a current ( $I$ ) to charge L6317 and C6343. Output voltage  $U_{out}$  is increased to the fan. With input D6302-9 high (normal temperature) output D6302-14 is high. Consequently, V6331 blocks and L6317 discharges ( $I_D$ ) via diode V6333 in V6334 via R6357. Lower output voltage is supplied to the fan.

Current-limiting at switch-on is given by transistor V6334 (off before C6343 charges). It also provides short-circuit protection for V6331.

Overvoltage protection for the fan is given by V6337, V6338 at 33 V. Transistor V6338 conducts when the output voltage exceeds 33V and the output voltage will be reduced via the emitter of V6331. Resistor R6345 reduces the current which is fed through V6338.

At 25 degrees C the supply to the fan is  $\approx 10$  V. It increases at higher temperatures to a maximum of 28 V, when it is limited by zener diode V6336, which gives a feedback voltage to comparator input pin 9.

CIRCUIT DESCRIPTION OF HIGH VOLTAGE CONVERTER UNIT (See fig.20.3).

In principle, the HV converter circuit consists of a control circuit, driving a feedback oscillator. The secondary circuit feeds a voltage doubler to provide the -2,2 kV c.r.t. output and a voltage multiplier in the secondary converter to give the 14,3 kV final accelerator voltage. A protection circuit switches off the converter in the event of a secondary converter failure to prevent damage to V6603 and its output.

Protection circuit

The collector voltage of oscillator V6603 is supplied from the +50 V [PRIM] line controlled by a protection voltage (+13 V) derived from the secondary converter. This circuit switches off the 50 V [PRIM] supply to the oscillator if the secondary converter fails (when the +13V is not available e.g. in case of overload). The zener diode V6608 normally holds the base of V6609 at +4.8 V so that this transistor conducts. In turn, pnp transistor V6611 conducts and switches the +50 V supply via the primary winding of T6601 to the oscillator V6603. If the +13 V fails for any reason, V6609 and V6611 block and disconnect the collector supply to V6603.

Control circuit

When V6603 conducts, part of the negative output on the secondary winding (-2,2 kV) is fed back via the phase compensation capacitors C6616, C6617, and voltage divider R6626, R6627, R6628, R6611 to the + input of comparator N6601. Here, the feedback voltage is compared with the reference voltage adjusted by R6601 applied to the - input. The 14,3 kV output voltage is adjusted by R6601. The regulation sensitivity at the + input N6601-3 (test-point X26) is approximately 1 V/1 kV output.

The overall resultant feedback builds up a negative voltage across the parallel capacitors C6603, C6604, which controls the base level of oscillator V6603 via the 3-turn winding. The oscillator thus works in class C operation. The control circuit influences the negative bias, which in turn controls the width of the collector current pulses (see fig.20.1)

The control action is as follows:

- If the secondary -2200 V output is too low (i.e. more positive) then the feedback voltage to N6601-3 is high.
- Output D6601-6 is therefore high (i.e. the negative charge on C6603, C6604 is lower), which tends to reduce the bias on V6603 base and consequently increases the  $I_C$  pulse-width.
- As a result the output voltage becomes higher (more negative).

Fig.20.1. Waveforms in high-voltage converter.

### Converter circuit

The converter consists of V6603 and transformer T6601 in a blocking oscillator circuit with the signal across the collector winding and base winding in phase. The collector current  $I_c$  starts the oscillator every 20  $\mu$ s, building up a 50 kHz sine-wave across the base winding connected to R6613 biased negatively by the feedback control. When the level of the sine-wave signal exceeds the 0.6 V base voltage then the transistor conducts to give the  $I_c$  pulses as described (see fig 19.4). On the secondary windings two output voltages are available:

- 1100 V on C6609.
- 1600 V on the input of H.V. multiplier (A15 on the secondary converter)

The 1100 V is doubled by the negative voltage doubler V6604, V6606 and C6611, resulting in -2200 V.

The -2,2 kV can be adjusted independently of the 14,3 kV by R6622 (adjustment range 250 V) via emitter follower V6607, to compensate for tolerances in the c.r.t sensitivities

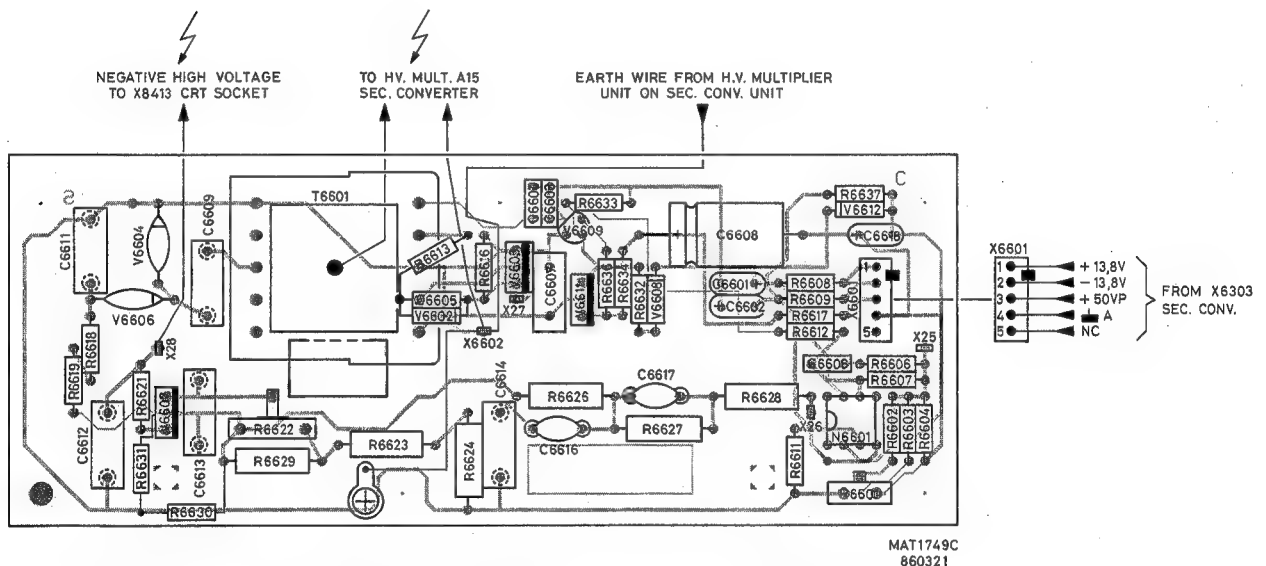

Fig.20.2. High-voltage converter, p.c.b. lay-out.

## 21. CIRCUIT DESCRIPTION OF MOTHERBOARD (See fig.21.2)

The mother board houses a number of miscellaneous circuit networks inter connections and connectors. These are now listed and briefly described.

### Illumination circuit (V7312-V7311)

The slider potential of the ILLUM control R12, derived from the +50 V [PRIM] coming from the secondary converter, is fed to an emitter-follower driver V7312, to reduce the base current through the slider. The driver is followed by a further emitter-follower, power transistor V7311, which supplies the series-connected graticule lamps E1, E2 (28 V/80 mA)

### Trace rotation (V7301-V7302)

The slider potential of the TRACE ROT control R16, derived from the +13.8 V and -13.8 V supplies, is fed to the bases of a complementary pair, V7301/V7302 also across these supplies. The common emitters of V7301/V7302 drive the trace rotation coil. If the slider of R16 goes positive then V7301 conducts to produce a positive-going current in the coil. Conversely, if the slider goes negative, V7301 blocks and V7302 conducts to produce a negative-going current in the coil.

### HEF 4094 bus (serial data in, parallel data out/D7301)

The serial input data DATA1, coming from the CPU-unit, is applied to D7301-2 and comes out of D7301 (10) as serial data DATA2, which is fed via X7309-14, to the adaptation unit of the attenuators. Integrated circuit D7301 on the HEF 4094 bus is controlled by the timing serial data lines SERCLK and ENSCP to give the parallel data outputs Q0 ...Q7.

Q0 drives the final Y amplifier unit via X7318-8 and X4001-8.

Q2 and Q6 are not used. Q1 is used to switch the LCD-illumination.

Q3 and Q4 are fed to the time base unit as Z control signals Z1 and Z2

Q5 is used to switch off the Hold off generator in Single mode and is fed to the time base (x9002-16)

Q7 is fed to the time base unit for Hold-off sawtooth control (H3).

### Data jumpers (see Fig. 21.1)

These jumpers (X7334, X7336 and X7337) on the mother board serve to connect the serial data stream when printed circuit boards are removed.

### 50-ohm protection lines (INPROT A and INPROT B)

Resistors R7301 and R7302 are each part of a voltage divider for the A and B attenuator circuit. These resistors adapt the 12 V potential in the attenuator to the 5 V level of the uP to give a warning if the 50-ohm input signal is out of the window range of the window discriminator.

### Fan NTC (R7323)

The NTC resistor R7323 on the mother board, fed from the secondary converter detects the temperature in the adjacency of the input attenuators.

### Protection of OQ200 (V7313)

When the circuit boards XZ amplifier, time base or final Y amplifier are removed, the OE- line can go to low and OQ200 could be damaged. Diode V7313 protects OQ200 against this possibility.

### Calibrator

The calibrator circuit consists of a divider circuit (D7302, D7303, D7304) to provide a 5 kHz square-wave followed by a controlled switched current source (V7304, V7306) to provide an accurate calibration voltage of 800 mV. Input signal for the divider circuit is a 3 MHz X-tal controlled sq.wave.

The 5 kHz square-wave output at 5 V level is applied to the base of V7304. Diode V7309 serves as a slope improver to sharpen up the square wave.

Transistor V7304 acts as a switch for the current source transistor V7306, the emitter preset R7321 providing the current source adjustment (output amplitude).

A constant base voltage of 4.4 V for V7306 is achieved by two series-connected zener diodes V7307, V7308. This results in a 0,8 V square-wave output over the 50-ohm resistor R7318 at the collector of V7306, switched by V7304 at a frequency of 5 kHz.

The 0 V level of the output signal occurs when switch V7304 conducts; the 0,8 V output level occurs when V7304 is blocked and constant current flows through V7306.

### Connectors on Mother Board.

The various connectors located on the mother board are given in Fig.21.2 together with their functional data.

A survey of signal names, which are present on the mother board, with their source and destinations (signal flow) is also given in fig.21.2.

Note: the interconnection path between the motherboard and the signal unit is somewhat different from the situation as given in figs. 21-1 and 21-2: the connector types for X7319 on the motherboard and X5325 on the signal unit are different and moreover an interconnection cable is added between the two units.

This unit incorporates the potentiometers that control the CRT functions and a 13,8 VDC into 300 VAC converter that supplies the LCD-illumination strip. These potentiometers are ILLUM (R12), FOCUS (R13), TRACE INTENSity (R14), READ OUT INTENSity (R15) and TRACE ROT (R16, screwdriver operated control).

The way these potentiometers are influencing the connected circuit, is described together with the circuit description of the relevant circuit part. The CRT controls unit is connected with the motherboard via a flat cable.

The 13,8 VDC/300 VAC generator consists of an oscillator V5901 that drives transformer T5901. Voltage stabilisation is achieved by means of a feedback circuit with the (zener) diodes V5902, V5903 and V5904. The LCD illumination strip H101 is connected to the generator output via connector X5903.

#### DESCRIPTION OF INFRA-RED RECEIVER (See fig.22.4)

The command signals from the remote control box are picked up by photo-diode V6001 and applied to pin 2 and pin 15 of IC N6001. This IC converts the pulses from V6001 into a "RC5" code. This coded signal is applied to pin 12 of N6002. This IC converts the "RC5" code into the proper "I2C" bus information present on the lines SDA (serial data), SCL (serial clock) and DAV (data valid).

## 23 PERFORMANCE CHECK

## 23.1 GENERAL INFORMATION

WARNING: Before switching-on, ensure that the instrument has been installed in accordance with the Installation Instructions outlined in Section 3 of the Operating Manual.

This procedure is intended to:

- Check the instruments' specification.
- Be used for incoming inspection to determine the acceptability of newly purchased instruments and/or recently recalibrated instrument.
- Check the necessity of recalibration after the specified recalibration intervals.

Note: The procedure does not check every facet of the instruments calibration; rather, it is concerned primarily with those parts of the instrument which are essential to measurement accuracy and correct operation. Removing the instruments covers is not necessary to perform this procedure. All checks are made from the outside of the instrument.

If the test is started within a short period after switching-on, bear in mind that steps may be out of specification, due to insufficient warming-up time.

Warming-up time under average conditions is 30 minutes.

The performance checks are made with a stable, well-focussed, low-intensity display. Unless otherwise noted, adjust the intensity and trigger-level controls as needed.

## IMPORTANT:

- NOTES
- \* At the start of every check, the controls always occupy the preliminary settings AUTO SET position, unless otherwise stated.
  - \* The input voltage has to be supplied to the A-input; unless otherwise stated.  
Set the TIME/DIV switches to a suitable position; unless otherwise stated.
  - \* Tolerances given are for the instrument under test and do not include test equipment error.
  - \* For some checks, we make use of the service routines. If you want additional information concerning these service routines refer to chapter 26.6.4. "description of service routines".
  - \* In this chapter in some checks channel B is mentioned between brackets behind channel A. It is advised to perform first channel A checks. After that the checks for channel B can be done.

IMPORTANT NOTE: ☐ These functions are only active after pressing AUTO SET, when they were active before AUTO SET was pressed!

fig. 23.1 Preliminary settings (AUTO SET)

23.2 Preliminary settings

- Switch-on the instrument (no input signal).
- Check if all leds and LCD's are on for 1 sec. during the power up routine.
- Press AUTO SET.
- Check if the frontcontrols are set as indicated in fig. 23.1.
- Check if the Y POS controls of channel A and B are manually adjustable after turning them through their mid-positions.
- Check if with the READ OUT control the intensity of the setting information and cursors can be controlled.

23.3 Recommended test equipment

The test equipment that must be used for this performance check is as given in section 25.2, except:

- 7. Trimming tool kit
- 10. Oscilloscope

Additional equipment for this performance check:

- BNC T piece and 50 ohm T piece PM9584
- 50 ohm attenuators 10x (20dB) and 2x (6dB)
- 50 ohm terminator

23.4 Checking procedure

1		POWER SUPPLY (characteristics: 2.2.15)
1.1	SUBJECT TEST EQUIPMENT  MAINS VOLTAGE  SETTINGS  REQUIREMENTS  MEASURING RESULTS	Mains voltage input Variable mains transformer  Between 90 V and 264 V ac (r.m.s.) Frequency: 45 Hz...440 Hz  - Press POWER ON - Apply CAL signal to input A - Press AUTO SET  - Starts at any mains voltage between 90 V...264 V ac (r.m.s.) - Instruments performance does not change over indicated mains voltage range; displayed CAL signal distortion-free and with equal intensity.
1.2	SUBJECT  TEST EQUIPMENT  MAINS VOLTAGE	Power Consumption (ac source)  Wattmeter  Mains voltage between 100 V and 240 V ac (r.m.s.). Frequency 50 Hz...400 Hz.

	SETTINGS	Press POWER ON
	REQUIREMENTS	Options excluded : 135W (typical) PM8950 (IEEE 488) option included: 138W (maximum)
	MEASURING RESULTS	
1.3	SUBJECT	Setting retention (characteristics: 2.2.16)
	TEST EQUIPMENT	-
	INPUT VOLTAGE	Apply the CAL signal to input A
	SETTINGS	<ul style="list-style-type: none"> <li>- Press AUTO SET, make a note of the front settings</li> <li>- Check if Memory Back Up batteries are installed.</li> <li>- Switch-off the instrument for approx. 15 min.</li> <li>- Switch-on the instrument</li> </ul>
	REQUIREMENTS	<ul style="list-style-type: none"> <li>- Check if the settings of the controls and the displayed signal are the same as at the moment of switching off.</li> </ul>
	MEASURING RESULTS	
1.4	SUBJECT	Front Unit Test
	TEST EQUIPMENT	-
	INPUT VOLTAGE	-
	SETTINGS	<ul style="list-style-type: none"> <li>- Press the INVERT buttons of channel A and B together to come into the Service Routine</li> <li>- Press vertical display mode A</li> <li>- Press vertical display mode TRIG VIEW</li> <li>- Press vertical display mode A</li> <li>- Press vertical display mode TRIG VIEW</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if all segments in the LCD's are on</li> </ul>
	SETTINGS	<ul style="list-style-type: none"> <li>- Press AUTO SET</li> <li>- Press vertical display mode A + B</li> <li>- Press vertical display mode A</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if all push-button leds are on</li> </ul>
	SETTINGS	<ul style="list-style-type: none"> <li>- Press AUTO SET</li> <li>- Press vertical display mode B</li> <li>- Press vertical display mode TRIG VIEW</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if the Y POS controls of channels A and B are locked and can only be released by turning the controls through their mid-position.</li> </ul>
	SETTINGS	<ul style="list-style-type: none"> <li>- Press AUTO SET four times to leave the Service routine</li> </ul>

	MEASURING RESULTS	
2.		DISPLAY (characteristics section 2.2.1)
2.1	SUBJECT	Illumination
	TEST EQUIPMENT	-
	INPUT VOLTAGE	-
	SETTINGS	Operate ILLUM control (fully clockwise)
	REQUIREMENTS	- Check if the graticule raster is equally illuminated and if the intensity can be controlled continuously.
	MEASURING RESULTS	
2.2	SUBJECT	Trace Rotation
	TEST EQUIPMENT	-
	INPUT VOLTAGE	-
	SETTINGS	- Operate screwdriver adjustment: TRACE ROT
	REQUIREMENTS	Trace must be in parallel with the horizontal graticule line. Direction of screwdriver rotation same as direction of trace rotation.
	MEASURING RESULTS	

3		VERTICAL DEFLECTION OR Y-AXIS (characteristics section 2.2.2)
3.1	SUBJECT	Vertical Deflection Sources, Deflection modes and input coupling.
	TEST EQUIPMENT	LF Square wave generator
	INPUT VOLTAGE	Square wave signal 1 kHz to A
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Set trace height to 5 div.</li> <li>- Press B; only channel A on</li> <li>- Check if one square wave signal of 5 div. is displayed.</li> <li>- Press B; channel A and B on</li> <li>- Check if a square wave signal (A) and line (B) is displayed and if A, B and ALT are on.</li> <li>- Press TRIG VIEW.</li> <li>- Check if two square wave signals (A and TRIG VIEW) and a line (B) are displayed and if TRIG VIEW, A, B and ALT are on.</li> <li>- Press TRIG VIEW; A, B and ALT on.</li> </ul>
	MEASURING RESULTS	
	INPUT VOLTAGE	Square wave signal 100Hz to A and B
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Press AUTO SET</li> <li>- Check if A, B and CHOP are on</li> <li>- Set trace height to 4 div.</li> <li>- Check if top and bottom lines of the two square waves are not flat (horizontal) due to AC coupling.</li> <li>- Press DC of A and B; check if correct square wave signals are displayed.</li> <li>- Press "0" of A and B, check if two lines are displayed.</li> <li>- Press DC of channel A and B.</li> <li>- Press A+B.</li> <li>- Check if 3 square wave signals are displayed: channels A and B each 4 div. trace height and A+B with 8 div. trace height.</li> </ul>
	MEASURING RESULTS

3.4	<p>SUBJECT</p> <p>TEST EQUIPMENT</p> <p>INPUT VOLTAGE</p>	<p>Channel isolation of Deselected Channel</p> <p>Sine-wave calibration generator (SG503)</p> <p>Sine-wave signal-50MHz, 4 V to input A(B)</p>

	SETTINGS	<ul style="list-style-type: none"> <li>- Apply sine-wave input signal to input A(B)</li> <li>- Press AUTO SET, and 50 Ohm on</li> <li>- Set the trace height to 8 div. (500 mV/div.)</li> <li>- Press B(A) (channel with input signal off).</li> <li>- Set Y AMPL of B(A) to 10 mV/DIV.</li> </ul>
	REQUIREMENTS	<ul style="list-style-type: none"> <li>- Check if trace height of channel without input signal B(A) is <math>\leq 4</math> div. (100:1)</li> </ul>
	MEASURING RESULTS	
3.4.1	SUBJECT	Channel isolation between Selected Channels
	TEST EQUIPMENT	HF sine-wave generator (SG503)
	INPUT VOLTAGE	200 MHz sine-wave signal, 4 V to input A(B)
	SETTINGS	<ul style="list-style-type: none"> <li>- Apply HF-sine wave signal to input A(B)</li> <li>- Press AUTO SET and 50 Ohm</li> <li>- Set the trace height to 8 div. (500 mV/div.)</li> <li>- Set the Y AMPL of both channels to 500 mV/div.</li> </ul>
	REQUIREMENTS	<ul style="list-style-type: none"> <li>- Check if trace height of channel without input signal B(A) is <math>\leq 0,16</math> div.</li> </ul>
	MEASURING RESULTS	
3.5	SUBJECT	Y-Signal Output
	TEST EQUIPMENT	Fast-rise square-wave generator (PG506)
	INPUT VOLTAGE	Square-wave signal of 1 kHz (fast-rise)
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Press AUTO SET</li> <li>- Connect the Y-output signal to the channel B(A) input socket.</li> <li>- Adjust channel B(A) to an input sensitivity of 10 mV/div. and 50 Ohm input impedance (DC coupled)</li> <li>- Press 50 ohm of A(B) (50 Ohm on)</li> <li>- Trigger the DEL'D TB on channel A(B) with AC-coupled filter.</li> <li>- Adjust the MAIN TB to a sweep of 200 us/div.</li> <li>- Trigger the MAIN TB on channel A(B) with AC-coupled filter</li> <li>- Apply a 1 kHz/6 div. square-wave signal to the channel A(B) input (DC-coupled) Y AMPL of A(B) to 100 mV/div.</li> <li>- Check if the amplitude of the square-wave displayed via channel B is equal to the channel A display (+or- 10%; or +or- 0,6 div.)</li> <li>- Set 50 Ohm of B(A) off.</li> <li>- Set Y AMPL of B(A) to 20 mV/div.</li> </ul>

- Check if the amplitude of the square-waves are equal (+or- 10%; or +or- 0,6 div.)
- Increase the frequency of the square-wave signal applied to channel A(B) to 1 MHz (rise-time  $\leq$  1 ns)
- Set 50 ohm of B(A) on
- Set Y AMPL of B(A) to 10 mV/div.
- Set MAIN TB to 200 ns/div.
- Press TRIG DTB (DTB trigger coupling)
- Press DC of DTB trigger coupling
- Check if signal displayed via B(A) has a dc shift.
- Press LF REJ of DTB trigger coupling
- Check if the top of the square wave signal displayed via B(A) is not flat.
- Press HF REJ; check if AC and HF REJ are on
- Check if the signal displayed via B(A) is changed into a triangle shaped signal.
- Press DC (DTB trigger coupling) twice (HF REJ off)
- Connect the Y-output signal to the channel A input socket.
- Adjust channel A to an input sensitivity of 10 mV/div. and 50 Ohm input impedance.
- Select A as MTB trigger source.
- Apply a 1 kHz/500 mV square-wave signal to the EXTERNAL trigger input of the DEL'D TB (DTB TRIG)
- Select the EXTERNAL trigger input as DEL'D TB trigger source
- Adjust the MAIN TB to a sweep speed of 500 us/div.
- Check if a square-wave signal is displayed via A with an amplitude of 5 div. (+or- 10%; or +or- 0,5 div.)
- Press EXT:10 (DTB trigger source)
- Check if the trace height is reduced to 0,5 div. (+or- 10%; or +or- 0,05 div.)

## MEASURING RESULTS

3.5.1	SUBJECT	Frequency Response of Y signal output
	TEST EQUIPMENT	HF sine-wave generator (SG503)
	INPUT VOLTAGE	Constant amplitude Sine-wave signal: dc...200 MHz
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- First the channel A bandwidth in 10 mV/div must be measured: adjust the amplitude of the 50 kHz sinewave to 6 div. Now increase the frequency to such a value that the signal amplitude at the screen decreases to 4,2 div. Now read the frequency of this signal (bandwidth of A = Fa)</li> <li>- Apply the Y OUT signal to input B.</li> <li>- Set Y AMPL of B to 10 mV/div (50 Ohm on and DC coupled).</li> </ul>

- Trigger the DEL'D TB on channel A with AC-coupled filter.
- Set the MAIN TB to 200.us/div.
- Trigger the MAIN TB on channel B with AC-coupled filter.
- Apply a 50 kHz/6 div. sine-wave signal to input A
- Set the amplitude of the signal displayed via B to exactly 6 div. as reference.
- Check the overall bandwidth (channel A and Y OUT) by increasing the frequency of the input signal on A till the amplitude displayed via B is 4,2 div. (-3dB) (overall bandwidth = Fo)
- The bandwidth of the Y OUT-put can be calculated with the formula:

$$\frac{1}{\sqrt{\frac{1}{(F_o)^2} - \frac{1}{(F_a)^2}}} = \text{Y OUT bandwidth}$$

Y OUT bandwidth must be dc...200 MHz  
(-3dB)

#### MEASURING RESULTS

3.6	SUBJECT	Vertical Deflection coefficients and input coupling of Channels A and B (characteristics section 2.2.3)		
	TEST EQUIPMENT	Square-wave calibration generator (PG506)		
	INPUT VOLTAGE	Square-wave signal 1 kHz to input A(B), amplitude 5 mVpp...20 Vpp in 1-2-5 steps		
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Apply a 1 kHz square wave signal of 5 mV to input A(B)</li> <li>- Press DC and 50 ohm must be off (BW LIMIT on)</li> <li>- Set the Y AMP to 1 mV/div.</li> <li>- Check if the amplitude of the signal is 5 div. (+or- 2%)</li> <li>- Increase the input amplitude and Y AMPL with the following steps:</li> </ul>		
	Input voltage (pp)	Y AMPL setting	Requirements	Measuring results
	10 mV	2 mV	5 div.(+or-2%)	
	20 mV	5 mV	4 div.(+or-2%)	
	50 mV	10 mV	5 div.(+or-2%)	
	0,1 V	20 mV	5 div.(+or-2%)	
	0,2 V	50 mV	4 div.(+or-2%)	
	0,5 V	100 mV	5 div.(+or-2%)	
	1 V	200 mV	5 div.(+or-2%)	
	2 V	500 mV	4 div.(+or-2%)	
	5 V	1 V	5 div.(+or-2%)	
	10 V	2 V	5 div.(+or-2%)	
	20 V	5 V	4 div.(+or-2%)	

3.6.1	SUBJECT	Vernier Ratio (continued procedure of 3.6) VAR		
	SETTING	- Turn VAR control fully anti-clockwise		
	REQUIREMENTS	- Check if displayed amplitude $\leq 1,6$ div. (1:2,5)		
	MEASURING RESULTS			
3.6.2	SUBJECT	Input coupling (continued procedure of 3.6.1)		
	SETTINGS AND REQUIREMENTS	- Turn VAR control fully clockwise. - Press "0"; check if input signal is interrupted. - Press AC and then DC; check if the displayed signal is shifted upwards.		
	MEASURING RESULTS			
3.7	SUBJECT	Input impedance and capacitance (1 Mohm and 50 Ohm)		
	TEST EQUIPMENT	Calibrated square-wave signal 1 kHz (PG506) via input dummy to input A(B). Dummy for 1 Mohm input: 1 Mohm resistor in parallel with a capacitor of 9 pF.		
		<u>1 Mohm Input impedance</u>		
	INPUT VOLTAGE	Square-wave signal 1 kHz to input A(B) via dummy, amplitude 10 mVpp...50 Vpp in 1-2-5 steps		
	SETTINGS AND REQUIREMENTS	- Apply calibrated square-wave signal of 10 mV via dummy to input A(B) (1 Mohm input) - Check the amplitude of the displayed signals according the table below:		
	Input voltage (pp) via dummy	Y AMPL setting	Requirements	Measuring results
	10 mV	1 mV	5 div.(+or-2%)	
	20 mV	2 mV	5 div.(+or-2%)	
	50 mV	5 mV	5 div.(+or-2%)	
	0,1 V	10 mV	5 div.(+or-2%)	
	0,2 V	20 mV	5 div.(+or-2%)	
	0,5 V	50 mV	5 div.(+or-2%)	
	1 V	100 mV	5 div.(+or-2%)	
	2 V	200 mV	5 div.(+or-2%)	
	5 V	500 V	5 div.(+or-2%)	
	10 V	1 V	5 div.(+or-2%)	
	20 V	2 V	5 div.(+or-2%)	
	50 V	5 V	5 div.(+or-2%)	
	- Remove input signal.			

		<u>50 Ohm input impedance</u>  INPUT VOLTAGE Fast-rise square-wave signal to input A (50 Ohm output of PG506)  SETTINGS - Apply fast-rise signal of 0,5 V to input A(B) - Press AUTO SET; 50 Ohm off . - Set Y AMPL to 100 mV/div. - Set trace height to 5 div. - Press 50 Ohm (50 Ohm on)  REQUIREMENTS - Check that the displayed signal has a trace height of 2,5 div. $\pm$ 1%.  MEASURING RESULTS
3.8	SUBJECT TEST EQUIPMENT INPUT VOLTAGE SETTINGS REQUIREMENT INPUT VOLTAGE SETTINGS REQUIREMENT MEASURING RESULTS	Vertical Dynamic range  Constant amplitude sine-wave generator  Sine-wave signal of 100 MHz, 2,4 Vpp to input A(B)  - Apply sine-wave signal of 100 MHz, 2,4 Vpp to input A(B). - Set Y AMPL to 100 mV/div. - Shift with the Y POS control the sine-wave vertically over the screen.  - Check if the top and bottom of the sine-wave signal can be displayed distortion-free (24 div. trace height). Compression at limits: 7%  Sine-wave signal of 200 MHz, 1,6 Vpp to input A(B)  - Set Y AMPL to 200 mV/div. - Increase the frequency of the input signal up to 200 MHz, trace height 8 div.  - Check if a sine-wave signal of 8 div. is displayed distortion-free. Compression at limits: 7%  MEASURING RESULTS
3.9	SUBJECT TEST EQUIPMENT INPUT VOLTAGE	LF linearity (vertical)  LF square-wave generator  Square-wave signal 50 kHz, 200 mV to input A(B)

	SETTINGS	<ul style="list-style-type: none"> <li>- Set Y AMPL to 100 mV/div.</li> <li>- Set the square-wave signal in the vertical centre of the screen.</li> <li>- Adjust the square-wave signal to exactly 2 div. trace height.</li> <li>- Shift the signal with the Y POS control to the two upper and lower div. of the screen.</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if the trace height in the two upper and lower div. is 2 div. <math>\pm 0,1</math> div.</li> </ul>
	MEASURING RESULTS	
3.10	SUBJECT	Shift range (vertical)
	TEST EQUIPMENT	LF Sine-wave generator
	INPUT VOLTAGE	Sine-wave signal of 1 kHz, 8 V to input A(B)
	SETTINGS	<ul style="list-style-type: none"> <li>- Adjust the channel A (B) input sensitivity to 1 V/div.</li> <li>- Apply a sine-wave of 1 kHz/8 div. to the channel A (B) input.</li> <li>- Adjust the channel A (B) input sensitivity to 500 mV/div.</li> <li>- Rotate the channel A (B) Y POS control fully clockwise and anti-clockwise</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if the top and the bottom of the signal can be positioned on the vertical centre line of the screen.</li> </ul>
	MEASURING RESULTS	
3.11	SUBJECT	Frequency response (in 50 Ohm and 1 Mohm position)
	TEST EQUIPMENT	Constant amplitude sine-wave generator (SG503) and PM5129 (for LF range 1 Hz...250 KHz)
	INPUT VOLTAGE	<p>Constant amplitude sine-wave signal, 30 mV frequency 50 kHz...200 MHz to input A (B).</p> <p><u>Input impedance 50 Ohm</u></p>
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Set Y AMPL to 5 mV/div.</li> <li>- Apply 50 kHz sine-wave signal to A (B) via 26 dB att.</li> <li>- Adjust trace height to exactly 6 div.</li> <li>- Increase the frequency of the input signal up to 200 MHz.</li> <li>- Check if the vertical deflection is <math>\geq 4,2</math> div. (<math>\sim 3</math> dB) over the complete bandwidth range between 10 Hz and 200 MHz.</li> </ul>

		<ul style="list-style-type: none"> <li>- Reduce the amplitude of the input signal to 6 mV and the frequency to 50 kHz.</li> <li>- Set Y AMPL to 1 mV.</li> <li>- Adjust the trace height to exactly 6 div.</li> <li>- Increase the frequency up to 60 MHz.</li> <li>- Check if the vertical deflection is <math>\geq 4,2</math> div. (-3 dB) over the complete bandwidth range between 10 Hz and 60 MHz (typical)</li> </ul> <p><u>Input impedance 1 Mohm</u></p> <ul style="list-style-type: none"> <li>- Same procedure as for 50 Ohm (input voltage lower via 50 Ohm att.of 26 dB and external 50 Ohm terminator)</li> <li>- Check if the vertical deflection is <math>\geq 4,2</math> div. over the frequency range of 1 Hz up to 175 MHz in the setting 5 mV/div.</li> <li>- And check for the 1 mV/div. setting if the vertical deflection is <math>\geq 4,2</math> div. over the frequency range of 1 Hz up to 60 MHz</li> </ul>
	MEASURING RESULTS	
3.12	SUBJECT	Bandwidth limiter
	TEST EQUIPMENT	Constant amplitude sine-wave generator (SG503)
	INPUT VOLTAGE	- Sine-wave signal of 20 MHz, 30 mV to input A (B)
	SETTINGS	<ul style="list-style-type: none"> <li>- Set Y AMPL to 5 mV/div. (50 Ohm on)</li> <li>- Adjust the trace height to exactly 6 div.</li> <li>- Press BW LIMIT 20 MHz</li> </ul>
	REQUIREMENTS	- Check if the amplitude of the signal is $\geq 4,2$ div. (-3 dB)
	MEASURING RESULTS	
3.13	SUBJECT	Pulse response (in 50 Ohm and 1 Mohm position)
	TEST EQUIPMENT	Fast-rise square-wave generator (PG506)
	INPUT VOLTAGE	Fast-rise square-wave signal ( $\leq 1$ ns) to input A (B)
	SETTINGS AND REQUIREMENTS	<p>Note: Take the pulse distortion of the calibration generator (2%) into account when performing the now following calibration steps. Check the calibration generator with a sampling oscilloscope. The pulse response of the signal at the output of the generator is optimal with max. pulse amplitude.</p>

## Pulse response (50 Ohm input impedance)

- The required fast rise-time square-wave must be obtained from the square-wave generator.
- Adjust channel A (B) to an input sensitivity of 20 mV/div.
- Select DC and 50 Ohm (generator termination) for channel A (B)
- Apply a 10 kHz/6 div. square-wave signal with 1 ns rise-time to input A (B)
- Set the MAIN TB to 20 us/div.
- Check the square-wave response; overshoot 5% or less.
- Apply a 100 kHz/6 div. square-wave signal with a 1 ns rise-time to input A(B)
- Set the MAIN TB to 2 us/div.
- Check the square-wave response; overshoot 5% or less.
- Apply a 1 MHz/6 div. square-wave signal with a rise-time of 1 ns to input A (B)
- Set the MAIN TB to 20 ns/div.
- Check the pulse response:  
overshoot must not exceed +or- 5%
- As described for 50 Ohm input impedance, only input signal must be applied to input A (B) via an external 50 Ohm terminator (50 Ohm output of generator)
- Check the square-wave response; overshoot 6% or less

## MEASURING RESULTS

3.14	SUBJECT	Rise-Time (in 50 Ohm and 1 M Ohm position)
	IMPORTANT	FOR BOTH INPUT IMPEDANCES, THE RISE TIME IS A CALCULATED VALUE, ACCORDING FORMULA: BANDWIDTH X RISE-TIME = 0,35
	TEST EQUIPMENT	Fast-rise square-wave generator (PG506)
	INPUT VOLTAGE	Fast-rise square-wave signal $\leq 1$ ns to input A (B) frequency: 1MHz. - In 50 Ohm position: output of generator directly connected to input A (B) - In 1 M Ohm position: output of generator via 50 Ohm terminator to input A (B)
	SETTINGS	- Set Y AMPL to 50 mV/div (in setting 2 mV/div, input signal via 50 Ohm attenuator 100:1). - Set MAIN TB to 20 ns/div. - Adjust the trace height exactly between the dotted lines 0% and 100% (5 div.) - Press TB MAGN
	REQUIREMENTS	Important: $T_R(\text{measured}) = \sqrt{T_R(\text{input signal})^2 + T_R(\text{oscilloscope})^2}$ - Check the rise-time, measured between the 10% and 90% lines (4 div.); the now following rise-times are based upon a generator rise-time of 0,9 ns. If your generator differs from this value you must recalculate with the above formula. * rise-time in 50 Ohm position (1 mV and 2 mV excluded): Ch. A(B): 1,95 ns or less Oscilloscope-only rise-time: 1,75 ns * rise-time in 1 M Ohm position (1 mV and 2 mV excluded): Ch. A(B): 1,95 ns or less Oscilloscope-only rise-time: 1,75 ns * rise-time in 1 mV and 2 mV/div. settings: Ch. A(B): 5,5 ns or less Oscilloscope-only rise-time: 5,45 ns
	MEASURING RESULTS	

3.15	<p>SUBJECT</p>   <p>SETTINGS AND REQUIREMENTS</p>          <p>MEASURING RESULTS</p>	<p>Base line instability (Jump)</p>  <p><u>Attenuator balance between any V/div. setting</u></p> <ul style="list-style-type: none"> <li>- This adjustment is done in the service routine "attenuator unit test". Proceed as follows to come into this routine: depress the channel A and B INVERT pushbuttons together, then depress the vertical display mode switch A two times, then depress switch A.</li> <li>- Now the channel A input sensitivity switches automatically between 5 mV and 500 mV.</li> <li>- Check if the trace jump of channel A is <math>\leq 0,2</math> div.</li> <li>- Press AUTO SET (1 time)</li> <li>- Press B</li> <li>- Now the channel B sensitivity switches automatically between 5 mV and 500 mV.</li> <li>- Check if the trace jump of channel B is <math>\leq 0,2</math> div.</li> <li>- Press AUTO SET 4 times to leave the service routine.</li> </ul>

5.		HORIZONTAL DEFLECTION OR X-AXIS (characteristics section 2.2.5)
	<p>5.1 SUBJECT</p> <p>TEST EQUIPMENT</p> <p>INPUT VOLTAGE</p>	<p>Horizontal Deflection Sources and trace separation</p> <p>LF sine-wave generator</p> <p>Sine wave signal 2 kHz, 3 div. trace height to input A</p>

# SETTINGS AND REQUIREMENTS

- Press AUTO SET, and press B; only A on
- Set the trace height to 3 div. (MTB trace)
- Set the MAIN TB to 500 us/div.
- Press MTB INTENS
- Set the DEL TB to 20 us/div.
- Check if intensified part (DTB) is visible and if it can be shifted horizontally by the DELAY or delta t control
- Press delta t
- Check if MTB INTENS and delta t are on and if two intensified parts are visible and if the second intensified part can be horizontally shifted by the DELAY or delta t control
- Press DTB
- Check if DTB, delta t and MTB INTENS are on and if the MTB INTENS trace with two intensified parts and two DTB traces that cover each-other are displayed over the complete screen width
- Set the TRACE SEP fully clockwise
- Check if the MTB INTENS trace and the two DTB traces cover each other completely.
- Set the trace in vertical mid-position
- Set TRACE SEP fully anti-clockwise
- Check if the traces are separated at least 4 div; MTB INTENS 2 div. upwards and the two DTB traces 2 div. downwards.
- Press EXT X DEFL
- Check if only EXT X DEFL is on of the horizontal deflection source selector.
- Press A of MTB trigger source
- Check if a line under an angle of 45° is displayed.
- Remove input signal of A
- Apply a sine wave signal 2 kHz, 600 mV to MTB TRIG or X DEFL input
- Press EXT and EXT:10 and LINE
- Check if a horizontal line is displayed.

## MEASURING RESULTS

5.2

### SUBJECT

Horizontal shift range

### TEST EQUIPMENT

Time marker generator (TG501)

### INPUT VOLTAGE

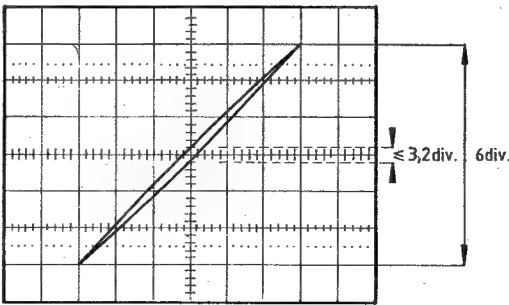

Time marker signal of 1 ms to input A

### SETTINGS AND REQUIREMENTS

- Set MAIN TB to 100 us/div.
- Set a marker pulse on the first and last vertical graticule line
- Set X POS fully clockwise.
- Check if the first marker pulse is at the right side of the horizontal centre line
- Set X POS fully anti-clockwise
- Check if the last marker pulse is at the left side of the horizontal centre line.

5.3	SUBJECT	Horizontal Deflection coefficients
	TEST EQUIPMENT	Sine wave generator
	INPUT VOLTAGE	Sine wave signal 2 kHz, 4 div. trace height to input A
	SETTINGS	<ul style="list-style-type: none"> <li>- Press EXT X DEFL</li> <li>- Press A of vertical mode; only B on</li> <li>- Press A as X DEFL source</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if a horizontal line of 4 div. is displayed (+ or -2%)</li> </ul>
	INPUT VOLTAGE	<ul style="list-style-type: none"> <li>- Sine wave signal 2 kHz, 1 V to input MTB TRIG or X DEFL</li> </ul>
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Press EXT as X DEFL source</li> <li>- Check if a horizontal line of 10 div. (+or- 5%) is displayed.</li> <li>- Press EXT:10</li> <li>- Check if a horizontal line of 1 div. (+or- 5%) is displayed.</li> </ul>
	MEASURING RESULTS	
5.4	SUBJECT	Maximum linearity error and line deflection
	TEST EQUIPMENT	LF sine-wave generator
	INPUT VOLTAGE	Sine-wave signal, 1 kHz, 8 div. trace height to input A
	SETTINGS	<ul style="list-style-type: none"> <li>- Set the Y AMPL of A to 200 mV/div.</li> <li>- Adjust the trace height to exactly 8 div.</li> <li>- Press EXT X DEFL</li> <li>- Press A of vertical display mode; only B on</li> <li>- Adjust the trace width to exactly 8 div.</li> <li>- Set Y APML of A to 2 V/div.</li> <li>- Turn the X POS control</li> </ul>
	REQUIREMENTS	<ul style="list-style-type: none"> <li>- Check if the horizontal deflection at the most lefthand side and righthand side of the screen is 0,8 div. (+or- 5%)</li> </ul>
	SETTINGS	<ul style="list-style-type: none"> <li>- Press LINE for horizontal deflection</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Check if the horizontal deflection if 7 div. +or- 1,5 div. (mains frequency: 49 Hz...61 Hz)</li> </ul>

	INPUT VOLTAGE	Time marker signal 1 us to input A (50 Ohm on)
	SETTINGS	<ul style="list-style-type: none"> <li>- Set MAIN TB to 200 ns/div.</li> <li>- Press B of vertical display mode; only A on</li> <li>- Press DTB of horizontal display mode; DTB and MTB INTENS on</li> </ul>

	REQUIREMENT	<ul style="list-style-type: none"> <li>- Set with the DELAY or delta t control the intensified part (DTB) on the second marker pulse</li> <li>- Set the marker pulse displayed via the DTB on the first and the second marker on the sixth graticule line (X POS)</li> <li>- Set the DTB VAR control fully anti-clockwise.</li> </ul>
	SETTINGS	<ul style="list-style-type: none"> <li>- Check if the DTB VAR control shifts the second marker pulse displayed via the DTB to the third graticule line or closer to the first marker (2,5:1)</li> </ul>
	REQUIREMENT	<ul style="list-style-type: none"> <li>- Set the DTB VAR control fully clockwise</li> <li>- Set the top of the second marker pulse displayed via the DTB exactly in the centre of the graticule</li> <li>- Press TB MAGN (on)</li> </ul>
	MEASURING RESULTS	<ul style="list-style-type: none"> <li>- Check if the top of the second marker pulse displayed via the DTB is not shifted more than +or- 0,4 div. (2 subdivisions)</li> </ul>
7.3	SUBJECT	Delay Time and Time Difference (delta t)
	TEST EQUIPMENT	Time marker generator (TG501)
	INPUT VOLTAGE	Time marker signal 10 us to input A via external 50 Ohm terminator
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Press B of vertical display mode; only A on</li> <li>- Apply a time marker pulse of 10 us via a 50 terminator to input A</li> <li>- The now following adjustments must be done in te service routine "time base test". Proceed as follows to come into this routine: depress the channel A and B INVERT pushbuttons together, then depress vertical display mode switch A and then B.</li> </ul>
		<p>DELAY TIME</p> <ul style="list-style-type: none"> <li>- Press vertical display pushbutton TRIG VIEW</li> <li>- Set Y AMPL of A to 1 V/div.</li> <li>- Select a MAIN TB sweep speed of 10 microsec/div.</li> <li>- Select a DEL'D TB sweep speed of 1 microsec/div.</li> <li>- Adjust the control X POS so that the MAIN TB display starts exactly at the first vertical graticule line.</li> <li>- Check if the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and if the intensified part on the MAIN TB display starts after a delay of 2 div. (+or- 2,2%)</li> </ul>

- Press vertical display pushbutton A
- Check if the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and if the intensified part on the MAIN TB display starts after a delay of 8 div. (+or- 2,2%)

## DELTA t

- Press vertical display pushbutton A+B
- Check if the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and if the intensified part on the MAIN TB display starts after a delay of 2 div. (0,6%).(Delay is 2 div.; delta T is 0 div.)
- Press vertical display pushbutton B.
- Check if the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and if the second intensified part on the MAIN TB display starts after a delay of 8 div. (0,6%).(Delay is 2 div.; delta T is 6 div.)
- Press AUTO SET three times to leave the service routine.

## MEASURING RESULTS

7.4	SUBJECT	DTB Position Range
	TEST EQUIPMENT	Time marker generator (TG501)
	INPUT VOLTAGE	Time marker signal 10 us to input A (50 Ohm on)
	SETTINGS AND REQUIREMENTS	<ul style="list-style-type: none"> <li>- Press B of vertical display mode; only A on</li> <li>- Press DTB of horizontal display mode; MTB INTENS and DTB on</li> <li>- Set MAIN TB to 5 us/div</li> <li>- Set DEL'D TB to 500 ms/div.</li> <li>- Turn DELAY or delta t control fully anti-clockwise</li> <li>- Check if the first marker pulse displayed via the DTB is partly visible; more than 0,2 x MTB setting is 1 us (2 div.) and if the Delay Time in LCD is &lt;1 us</li> <li>- Set the first marker displayed via the MTB exactly on the first graticule line</li> <li>- Turn DELAY or delta t fully clockwise</li> <li>- Check if the last marker pulse displayed via the DTB is completely visible and if the Delay Time displayed in the LCD is &gt;49,5 us.</li> </ul>
	MEASURING RESULTS	

7.5	SUBJECT	Maximum Jitter (DTB)
	TEST EQUIPMENT	Sine-wave generator
	INPUT SIGNAL	Sine-wave signal (1 MHz), 6 div. trace height to input A.
	SETTINGS	<ul style="list-style-type: none"> <li>- Set the trace height to 6 div.</li> <li>- Press B of vertical display mode; only A on</li> <li>- Set MAIN TB to 1 ms</li> <li>- Press DTB of horizontal display mode.</li> <li>- Set DEL'D TB to 500 ns</li> <li>- Set the DELAY time to 5 ms</li> <li>- Press MTB INTENS; only DTB on</li> </ul>
	REQUIREMENT	- Check if the jitter of the DTB trace is $\leq 1$ div. (1 part per 20.000)
7.6	MEASURING RESULTS	
	SUBJECT	DTB Gate Out
	TEST EQUIPMENT	-
	INPUT SIGNAL	DTB Gate Out (rear side) to input A
	SETTINGS	<ul style="list-style-type: none"> <li>- Press DC and B of vertical display mode, only A on</li> <li>- Set Y AMPL of A to 2 V/div.</li> <li>- Apply DTB gate out signal to input A</li> <li>- Set MAIN TB to 20 us/div.</li> <li>- Press MTB INTENS</li> <li>- Set DEL'D TB to 1 us/div.</li> <li>- Set the DELAY or delta t control to 100 us</li> </ul>
8.	REQUIREMENT	- Check if the DTB gate out is visible and switches between 0 and 5 V (first 5 div. 0 V) DTB running: level must be between 2,4...5 V.
	MEASURING RESULTS	
8.		MTB TRIGGERING (characteristics, section 2.2.8)
8.1	SUBJECT	MTB Trigger Sources and trigger coupling
	TEST EQUIPMENT	Square-wave generator
	INPUT VOLTAGE	Square-wave signal 2 kHz, 4 div. trace height to input A (EXT)

# SETTINGS AND REQUIREMENTS

- Press 20 MHz BW LIMIT (on)
- Set the trace height to 4 div.
- Press TRIG VIEW and A and B of vertical display mode; only TRIG VIEW on
- Press DC of MTB trigger coupling
- Check if a square wave signal is displayed of 4 div.
- Press LF REJ of MTB trigger coupling
- Check if a differentiated square wave is displayed
- Press HF REJ of MTB trigger coupling
- Check if a square-wave signal with slower slopes is displayed and if AC and HF REJ are on
- Press AC of MTB trigger coupling
- Connect CAL signal to input B
- Set Y AMPL of B to 200 mV.
- Press B of MTB trigger source
- Check if a square wave of 5 div. is displayed
- Increase the freq. of the square-wave signal to input A up to 20 kHz (CAL signal to B)
- Press A and B of vertical display mode.
- Press COMP of MTB trigger source.
- Check if three well triggered traces are displayed; TRIG VIEW signal derived from A.
- Remove input signals
- Apply a square wave signal of 500 mV to input MTB TRIG
- Press EXT of MTB trigger source
- Check if a square wave signal is displayed via TRIG VIEW of 5 div.
- Press EXT:10 of MTB trigger source
- Check if a square wave signal of 0,5 div is displayed via TRIG VIEW.
- Press LINE of MTB trigger source
- Check if a sine-wave signal (mains frequency) is displayed.

## MEASURING RESULTS

8.2

### SUBJECT

Trigger Sensitivity (MTB)

### TEST EQUIPMENT

Sine-wave generator (SG503)

### INPUT VOLTAGE

Sine-wave signal 100 MHz (200, 250 MHz) to input A(B) or EXT

# SETTINGS AND REQUIREMENTS

- Press DC (input coupling of A(B))
- Press 50 Ohm (50 Ohm on)
- Press TRIG (MTB trigger mode)
- Apply a sine-wave signal of 100 MHz approx. 250 mVpp to input A(B)
- Set Y AMPL to 200 mV/div.
- Decrease amplitude of input signal
- Turn LEVEL MTB
- Check if the signal is well-triggered at amplitudes  $\geq$  0,5 div.
- Increase the frequency of the input signal up to 200 MHz.

MEASURING RESULTS	<ul style="list-style-type: none"> <li>- Decrease amplitude of input signal</li> <li>- Turn LEVEL MTB</li> <li>- Check if the signal is well-triggered at amplitudes <math>\geq 1</math> div.</li> <li>- Remove input signal.</li> <li>- Apply a sine wave signal of 100 MHz, 50 mVpp to input MTB TRIG or X DEFL (via external 50 Ohm terminator)</li> <li>- Press EXT (MTB trigger source)</li> <li>- Press TRIG VIEW, A and B (only TRIG VIEW on)</li> <li>- Turn LEVEL MTB</li> <li>- Check if a well triggered sine-wave of 0,5 div. (50 mV) is displayed.</li> <li>- Decrease amplitude of input signal</li> <li>- Check if the signal is well triggered at amplitudes <math>\geq 50</math> mV (adjust LEVEL MTB)</li> <li>- Increase the amplitude of the input signal up to 500 mVpp</li> <li>- Press EXT:10 (MTB trigger source)</li> <li>- Check if the signal is well triggered at amplitudes <math>\geq 500</math> mV (adjust LEVEL MTB)</li> <li>- Increase the frequency of the input signal up to 250 MHz, 3 Vpp.</li> <li>- Check if the signal is well triggered at amplitudes <math>\geq 3</math> V (adjust LEVEL MTB)</li> <li>- Press EXT (MTB trigger source)</li> <li>- Decrease the amplitude of the input signal to 300 mV.</li> <li>- Check if the signal is well triggered at amplitudes <math>\geq 300</math> mV (adjust LEVEL MTB)</li> </ul>

# SETTINGS AND REQUIREMENTS

The buttons that must be pressed in the following procedure are located on the Setting Memory Remote control

- Press AUTO SET
- Check if this action has the same result as the AUTO SET button on the oscilloscope and if two square wave signals that cover each other are displayed:  
Y AMPL setting: 200 mV/div (5 div. trace height)  
MAIN TB setting: 100 us/div (5 div. repetition time)
- Change the vertical and horizontal settings to get different information for the following checks.
- \* SAVE
  - Select a frontnumber (1...75)
  - Press SAVE
  - Check if the actual frontsettings are stored under the selected frontnumber, by pressing selected frontnumber and RECALL

## \* INSERT

- Select a frontnumber (1...75)
- Press INSERT
- Check if the actual frontsettings are stored under the selected frontnumber (in between two already stored frontnumbers), by pressing frontnumber and RECALL.

## \* DELETE

- Select a frontnumber (1...75)
- Press DELETE
- Check if the selected frontnumber is erased by pressing selected frontnumber and RECALL (on screen is indicated: CANCELLED)

## \* RECALL

- Select a frontnumber (1...75)
- Press RECALL
- Check if the selected frontnumber is displayed. (if a frontnumber is selected that was not stored or erased, on screen is indicated: CANCELLED)

## \* NEXT

- Press NEXT
- Check if the front settings of the next frontnumber are displayed.  
If a frontnumber is erased it will be skipped.

## \* PREVIOUS

- Press PREVIOUS
- Check if the front settings of the previous frontnumber are displayed.  
If a frontnumber is erased it will be skipped

## \* FCN

- Switch the oscilloscope off and on (memory back-up batteries must be present)
- Check if the stored front settings are WRITE PROTECTED and can only be RECALLED (PREVIOUS, NEXT).
- Press 3
- Press FCN
- Check if the stored front settings are NOT WRITE PROTECTED, and can be changed with the commands SAVE, DELETE and INSERT

## Programming IDENTIFICATION NUMBER (ID)

- Select ID Number (0...9)
- Press 2
- Press FCN
- Check if the ID number is programmed and is displayed on the right upper part of the crt screen.

## Cancel IDENTIFICATION NUMBER (ID)

- Select the ID number that must be cancelled (0...9)
- Press 1
- Press FCN
- Check if the ID number is cancelled.

13.2

## SUBJECT

Maximum Transmission distance and angle

## TEST EQUIPMENT

-

## INPUT VOLTAGE

-

## SETTINGS

- Press AUTO SET (of remote control)

## REQUIREMENTS

- Check if the oscilloscope reacts at a distance of typical 3,5 m at an angle of max. 5° off axis.
- Check if the oscilloscope reacts at a distance of 0,5 m on axis at a vertical angle of +or- 45° off axis and at a horizontal angle of +or- 35° off axis

24.2.	Removing the instrument's covers.	24-1
24.3.	Access to parts for the checking and adjusting procedures.	24-1

## 24. DISMANTLING THE INSTRUMENT.

### 24.1. GENERAL INFORMATION

This section provides the dismantling procedures required for the removal of components during repair operations.

All circuit boards removed from the instrument must be adequately protected against damage, and all normal precautions regarding the use of tools must be observed.

During dismantling a careful note must be made of all disconnected leads so that they can be reconnected to their correct terminals during assembly.

CAUTION: Damage may result if:

- The instrument is switched on when a circuit board has been removed.
- a circuit board is removed within one minute after switching-off the instrument.

### 24.2. REMOVING THE INSTRUMENT'S COVERS

The instrument is protected by three covers: a front-panel protection cover, a cabinet with carrying handle and a rear panel. To facilitate the removal of the instrument's cabinet and rear panel, first put the front-panel protection cover in position.

Then proceed as follows:

- Hinge the carrying handle clear of the front protection cover.
- Stand the instrument on its protective front cover on a flat surface.
- Slacken the four screws present in the feet at the rear panel.
- Slacken the four smaller screws that are also present in the rear panel: the rear panel can now be lifted.
- Remove one screw from the bottom side of the instrument.
- The instrument's cabinet (with carrying handle) can be removed by lifting it clear of the instrument.

NOTE: If necessary bend out the cabinet at the side of the rubber feet so that the feet do not catch behind the frame parts. When reinstalling the cabinet again, take care that the wiring (coaxial cables and flat cables) is not damaged.

### 24.3. ACCESS TO PARTS FOR THE CHECKING AND ADJUSTING PROCEDURES

After the actions performed in chapter 24.2. almost all adjustment points are accessible. However for the access to a minority of the adjustments, some additional actions are necessary. These actions are mentioned in the chapter "checking and adjusting".

## 25. CHECKING AND ADJUSTING

### 25.1. GENERAL INFORMATION

The following information provides the complete checking and adjusting procedure for the instrument. As various control functions are interdependent, a certain order of adjustment is necessary. The procedure is, therefore, presented in a sequence which is best suited to this order, cross-reference being made to any circuit which may affect a particular adjustment. Before any check or adjustment, the instrument must attain its normal operating temperature.

- Warming-up time under average conditions is 30 minutes.
- Where possible, instrument performance should be checked before any adjustment is made.
- All limits and tolerances given in this Section are calibration guides, and should not be interpreted as instrument specifications unless they are also published in Section 2.2.
- Tolerances given are for the instrument under test and do not include test equipment error.
- The most accurate display adjustment are made with a stable, wellfocused low intensity display.
- All controls which are mentioned without item numbers are located on the outside of the instrument.

**WARNING:** The opening of covers or removal of parts, except those to which access can be gained by hand, is likely to expose live parts, and also accessible terminals may be live. The instrument shall be disconnected from all voltage sources before any adjustment replacement or maintenance and repair during which the instrument will be opened. If afterwards any adjustment, maintenance or repair of the opened instrument under voltage is inevitable, it shall be carried out only by a qualified person who is aware of the hazard involved. Bear in mind that capacitors inside the instrument may still be charged even if the instrument has been separated from all voltage sources.

## 25.2. RECOMMENDED TEST AND CALIBRATION EQUIPMENT

Type of instrument	Specification	Used for	Example of required instruments
1. Constant amplitude sine-wave generator.	Freq. 50kHz.. 250MHz Voltage 10mV.. 5Volt	Bandwidth check of vertical channels and triggering	Tektronix SG503
2. Time marker generator	Repetition rate 1sec ... 2ns	Checking and adjusting of time base sweep rates including MAGN X10.	Tektronix TG501.
3. Square-wave calibration generator	Rise-time 1nsec. Voltage 10mV up to (for preference) 30V Duty cycle 50%	Checking and adjusting of square-wave response of vertical channels and triggering	Generator with additional attenuators partly PG506. For check of rise time PG506 and belonging tunnel diode pulser (type 067/0681/01).
4. LF sine-wave /sq.-wave generator	Sine-wave Freq.: 1Hz... 1MHz Voltage: 0... 30Volt  Square-wave Freq.: 1Hz... 1MHz Voltage: 0... 30Volt  Rise time: faster then 100ns	Checking the trigger sensitivity  Checking and adjusting sq.-wave response of for instance- attenuator unit	Philips PM5131
5. Cables, T-piece, terminations and attenuators for the generators	General Radio types for fast rise-time sq.-wave and high frequency sine-wave.  BNC-type for other applications.	see point 1 and 3  see point 2 and 4	
6. Dummy probe 2:1	1 M.0hm $\pm 0,1\%/9pF$	Check of input capacitance	

7. Trimming tool kit	--	Adjustments	Philips SBC317 (ord. number 4822 310 50095)
8. Variable mains transformer.	Well-insulated Output voltage 90...264VAC	Checking influence of mains voltage variations and adjustment of power supply.	Philips ord. number 2422 529 00005
9. Wattmeter		Checking the power consumption of the instrument	
10. Oscilloscope	The bandwidth must be the same or higher than the bandwidth of the instrument under test.	Checking the instrument under test	Philips PM3295A/85A
11. Digital multimeter	Wide voltage, current and resistance ranges. Required accuracy 0,1%	Checking the instrument under test.	Philips PM2718 and high-voltage probe PM9246/03

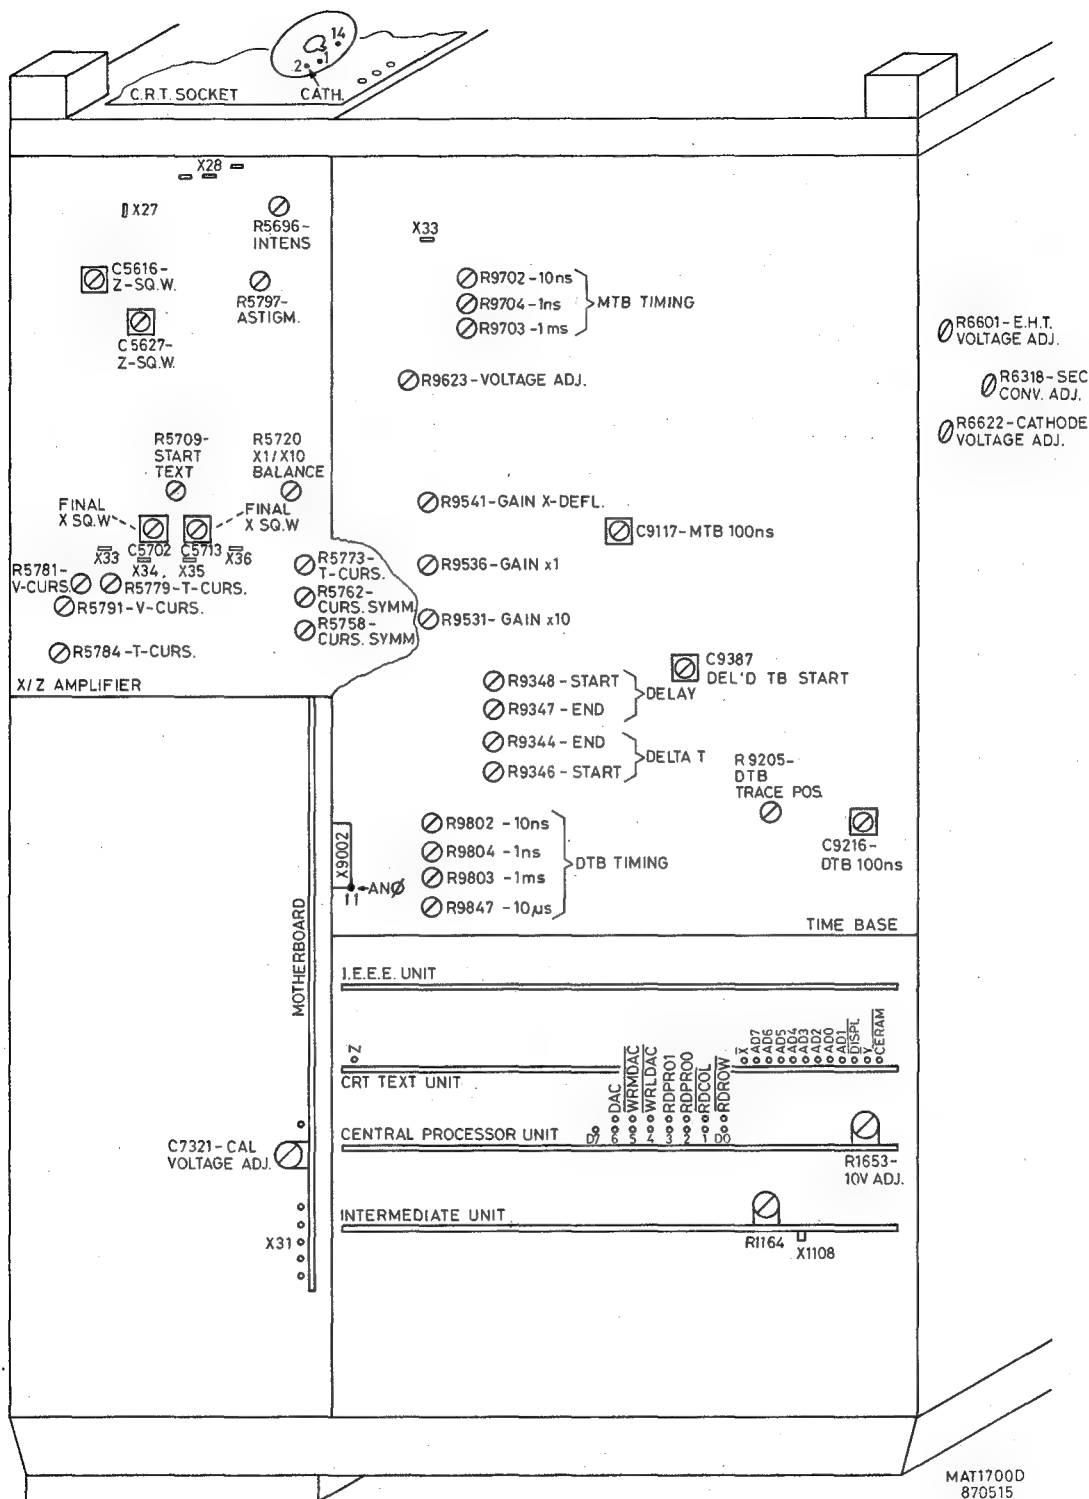

Fig. 25.1. Adjustment points, top view.

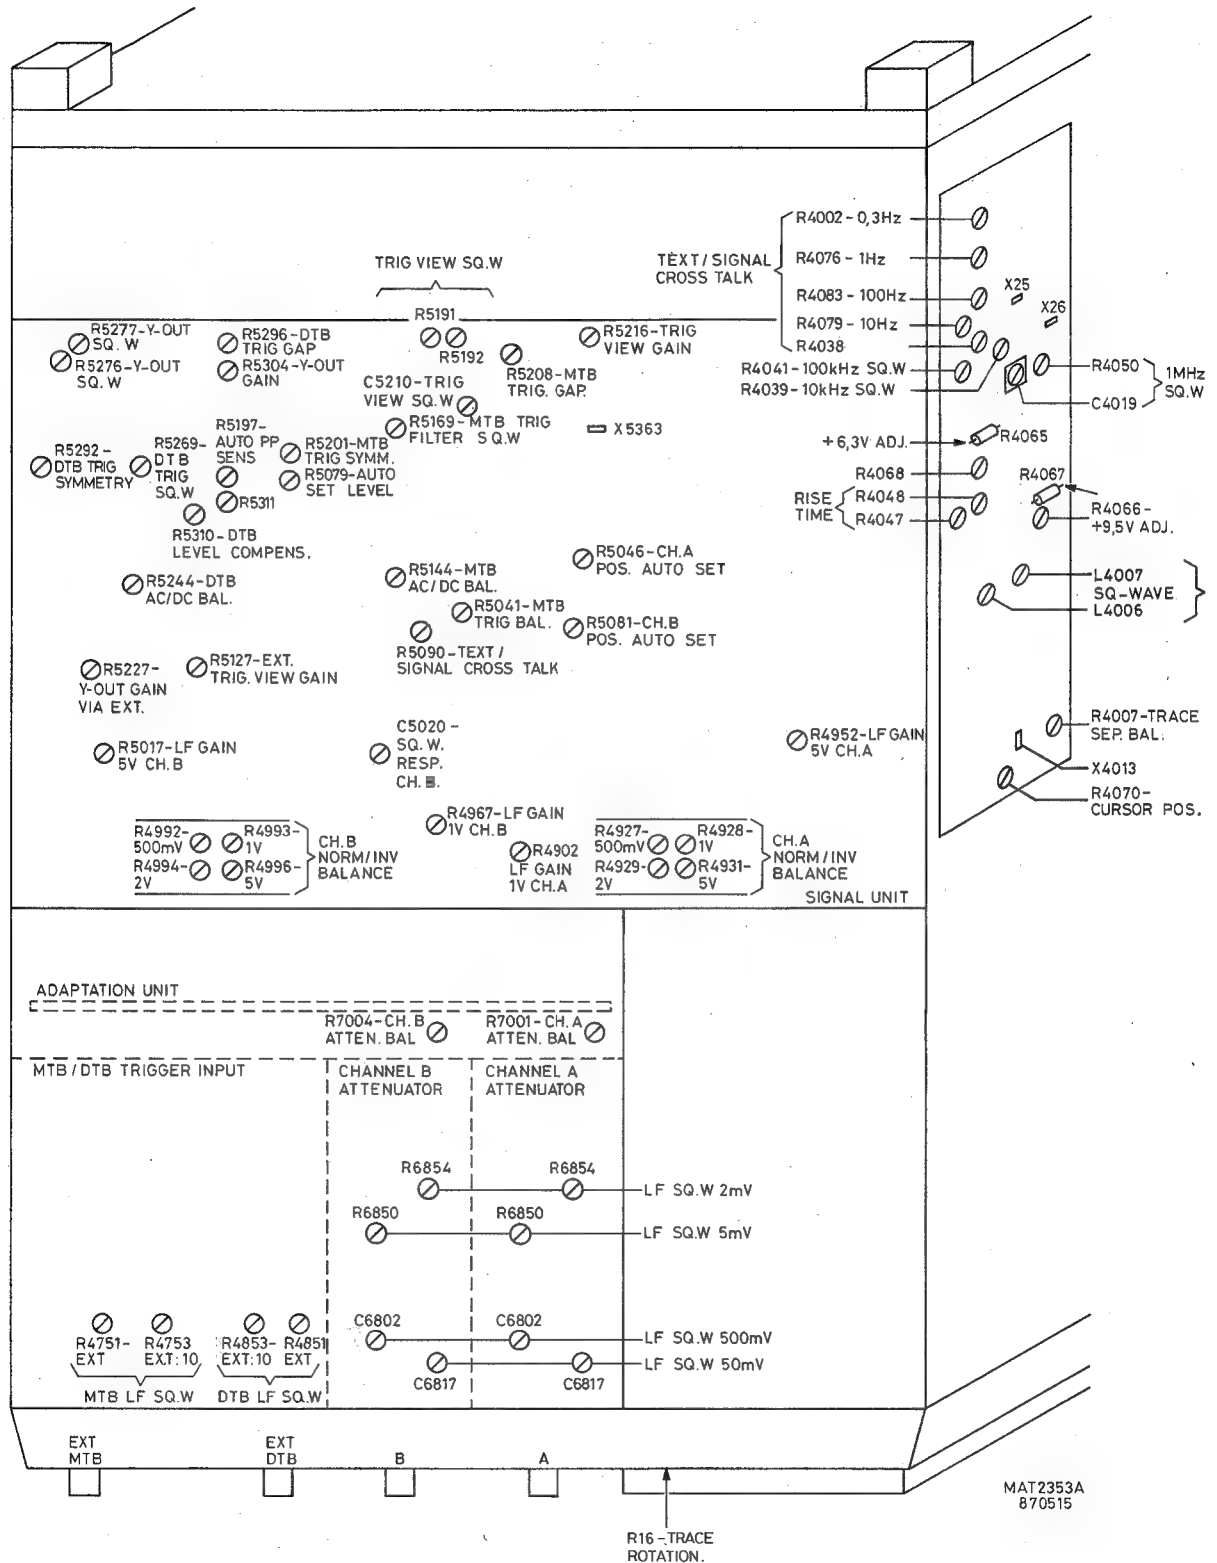

Fig. 25.2. Adjustment points, bottom view.

## 25.3. CHECKING AND ADJUSTING PROCEDURE

The adjusting elements and measuring points are given in fig. 25.1 and fig. 25.2.

NOTE: Use always an isolated adjustment tool.

## 25.3.1. Preparation

Before starting the checking and adjusting procedure, it is necessary to take notice of the following.

- For some adjustments, we make use of the service routines. If you want additional information concerning these service routines refer to chapter 26.6.4. "description of service routines".
- Unless otherwise indicated, the MAIN TB must be triggered on the channel that is selected for vertical display and the trigger path is AC coupled. The MAIN TB must function in the AUTO mode and its sweep speed must be adjusted to a good visibility of the phenomena of interest. The DEL'D TB is not used. The INTENS and FOCUS controls must be adjusted to a well-defined trace and text display.
- The various adjustment steps in this procedure must be carried out in the given sequence. Within a certain chapter (e.g. adjustment of CRT-display section), the knob settings belonging to a certain adjustment are based upon the settings done in the preceding adjustment step.

## 25.3.2. Power supplies, supply voltages on various printed circuit boards and astigmatism.

Secondary power supply (R6318).

The output voltages can be adjusted with R6318.

This adjustment point is attainable via a hole in the right side panel of the instrument. Now proceed as follows:

- Connect a digital voltmeter to tag X31 on the motherboard. The tag carries the supply voltage + 5 Volt for the analog circuits.
- Check if the voltage is + 5 Volt exactly.
- If not readjust R6318.

Supply voltages on final Y-amplifier (R4066, R4068)

- Connect a digital voltmeter between the instrument's measuring earth and R4067.
- Adjust R4066 to a supply voltage of + 9,5 Volt.
- Connect a digital voltmeter between the instrument's measuring earth and R4065.
- Adjust R4068 to a supply voltage of + 6,3 Volt.

High voltage converter (R6601).

The two adjustment points on this unit can be adjusted via holes present in the right side panel of the instrument. During the adjustment of R6601 the -2320 Volt present at the cathode of the CRT must be monitored with a digital multimeter via a high-voltage probe. The measuring point can be reached after removal (4 screws) of the rear plate that covers the CRT-socket: the cathode is pin 2 of the CRT-socket.

ATTENTION: Be aware that after removal of the rear plate, several points can be touched that carry dangerous live voltages.

Now proceed as follows:

- Set R6622 completely anti-clockwise (maximum negative voltage level on cathode of CRT).
- Adjust R6601 to -2320 Volt (or slightly smaller if the adjustment of R6622 is not possible) present at the cathode of the CRT.
- Reinstall the rear plate again.

Astigmatism (R5797, X/Z-amplifier).

- This adjustment is done in the service routine "CRT text unit test". Proceed as follows to come into this routine: depress the channel A and B INVERT pushbuttons together, depress the vertical display mode switches A, then TRIG VIEW, then CHOP and finally ALT.
- Turn the TRACE INTENSITY off.
- Turn the READ OUT INTENSITY on (normal Intensity) and a grid with equidistant horizontal and vertical lines is displayed.
- Adjust R5797 to maximum sharpness of all the lines of the grid. The adjustment can also be done with a number of periods of a 8 div. peak-to-peak sine-wave on the screen.
- Depress AUTO SET four times to leave the service routine.

Alternative way of astigmatism adjustment (R5797, X/Z-amplifier)

- Apply a 10 kHz sinewave to the channel A input and display approx. 3 periods of it at an amplitude of 6 div.
- Switch the bandwidth limiter on.
- Adjust R5797 so that the sharpness of the sinewave is equal across the screen at normal Intensity.
- Switch the bandwidth limiter off again.

High voltage converter (R6622).

- The now following adjustment of the CRT-cathode voltage (R6622) is based upon the fact that the CRT sensitivity is influenced by this cathode voltage.
- Apply a 10kHz sine-wave signal to the channel A input socket and display this signal on the screen.
- Adjust the sine-wave amplitude at the generator so that the R.M.S. value of the voltage measured with a digital voltmeter between pin X25 and X26 at the final Y-amplifier is exactly 212,1 mV.
- Adjust R6622 so that a vertical display of 6 div. is present on the screen.

\* READJUST THE ASTIGMATISM (R 5797) AS INDICATED ABOVE!!!

Trace rotation (R16, front panel)

Adjust the trace exactly in parallel with the horizontal graticule lines.

Potentiometer supply voltage on intermediate unit (R1164).

- Remove the metal plate that covers the compartment of the front unit: the plate is fixed with six screws. This action is not necessary in newer instruments where the top cover plate is provided with holes through which the adjustment can be done.
- Connect the digital voltmeter between the instrument's chassis and tag X1108.
- Adjust R1164 so that the voltage across X1108 is exactly 10 Volt.

DAC supply voltage on central processor unit (R1653).

- Select MTB INTENS for horizontal display.
- Select 1  $\mu$ sec/div for DEL'D TB and 10  $\mu$ sec/div for MAIN TB.
- Select the maximal delay time (100  $\mu$ sec).
- Connect a digital voltmeter between X9002/11 on the time base and the instrument's chassis.
- Adjust R1653 on the central processor unit to a voltmeter read-out of 10 volt.

Supply voltage on time base unit (R9623)

- Connect a digital voltmeter between the instrument's measuring earth and measuring point X33 on the time base.
- Adjust R9623 to a supply voltage read-out of 15,03 Volt.

## 25.3.3. Adjustment of CRT display section.

Intensity (R5696, X/Z amplifier)

- Select EXT X DEFL for horizontal display.
- Position the displayed point in the mid of the screen and adjust the FOCUS control for a well-focused display.
- Turn the TRACE INTENSITY and READ OUT INTENSITY control fully anti-clockwise.
- Adjust R5696 so that the point is just invisible.

Square-wave response of Z-amplifier (C5616, C5627, X/Z-amplifier)

- Apply a sine-wave with a frequency of at least 1MHz to the channel A input
- Trigger the MAIN TB on channel A.
- Select X-deflection by the MAIN TB.
- Select AUTO mode for the MAIN TB.
- Select the MAIN TB sweep time of 20 n.sec/div.
- Switch the TRACE INTENSITY on and the READ OUT INTENSITY off.
- Connect your measuring oscilloscope to tag X27 (X28) on the X/Z amplifier. Trigger the measuring scope on the sine-wave signal.
- Adjust C5616 and C5627 for a straight pulse top and a good square-wave response. Adjust the main time base sweep time of your measuring oscilloscope for a good read-out of the pulse response on X27 (X28).
- Remove the probes.

Text adjustment on final Y-amplifier (R4002, R4038, R4076, R4079, R4083, R5090/signal unit).

- Switch the TRACE and READ OUT INTENSITY on.
- Remove jumper X4013.
- Apply a 100Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 10 msec/div.
- Adjust R4083 so that the bottom side of the text display is not affected (does not move) by the signal display.
- Apply a 10Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 20 msec/div.
  
- Adjust R4079 so that the bottom side of the text display is not affected (does not move) by the signal display.
- Apply a 1Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 200 msec/div.
- Adjust R4076 so that the bottom side of the text display does not move.
- Apply a 0,3Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 500 msec/div.
- Adjust R4002 so that the bottom side of the text display does not move.
  
- Apply a 100Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 10 m.sec/div.
- Adjust R4083 so that the bottom side of the text display is not affected (does not move) by the signal display.
- Apply a 10Hz/8 div. sine-wave to the channel A input.

- Select the MAIN TB sweep time of 20 msec/div.
- Adjust R4079 so that the bottom side of the text display is not affected (does not move) by the signal display.
- Adjust R4038 so that the top side of the text display is not affected (does not move) by the signal display.
- Apply a 1Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 200 msec/div.
- Adjust R4076 so that the bottom side of the text display does not move.
- Apply a 0,3Hz/8 div. sine-wave to the channel A input.
- Select the MAIN TB sweep time of 500 msec/div.
- Adjust R4002 so that the bottom side of the text display does not move.
- Remove the input signal.
- Select MTB for horizontal display and adjust the MAIN TB to a sweep speed of 10 ms/div.
- Select channel A and B in ALTERNATE mode for vertical display.
- Shift the channel A trace upon the top graticule line.
- Shift the channel B trace upon the bottom graticule line.
- Adjust R5090 on the signal unit so that the text display does not move.

#### 25.3.4. Chopper cross talk (R4039, final Y amplifier)

- Switch channel A and B on in CHOP mode.
- Apply a 10 kHz/8div square wave to channel A.
- Shift channel B in the vertical mid of the screen and select an input sensitivity of 20mV/div.
- Trigger the MAIN TB on channel A and select a sweep speed of 20 microsec/div.
- Adjust R4039 so that the crosstalk from channel A on channel B is minimal.

#### 25.3.5. Adjustment of balances and gain of channel A (B) on signal unit.

NOTE: In this chapter the adjustments of channel B are mentioned between brackets behind those of channel A. It is advised to perform first the channel A adjustments in this chapter. After that the adjustments for channel B must be done.

#### Channel A (B) attenuator balance (R7001 R7004, adaptation unit).

- This adjustment is done in the service routine "attenuator unit test". Proceed as follows to come into this routine:
- \* Depress the channel A and B INVERT pushbuttons together in order to come in the service routine.
- \* Depress pushbutton A two times.
- \* Depress pushbutton A(B) for adjustment of channel A(B). The change between A and B must be done via AUTO SET.  
The input sensitivity in the selected channel switches automatically between 5 and 500 mV/div.
- Adjust R7001 (R7004) so that the trace jump is minimal.
- Depress AUTO SET four times to leave the service routine

#### Gain adjustments channel A (B) (R4902, R4952, R4967, R5017, signal unit).

- Apply a 1kHz/2 Volt calibrated square-wave signal to the channel A (B) input.

- Trigger the instrument on channel A (B).
- Adjust the MAIN TB sweep time to 500 microsec/div.
- Adjust the vertical input sensitivity to 500 mV/div.
- Adjust R4902 (R4967) to a vertical display of exactly 4 divisions.
- Increase the generator output voltage to 20 Volt.
- Adjust the vertical input sensitivity to 5 Volt/div.
- Adjust R4952 (R5017) to a vertical display of exactly 4 divisions.

Normal/Invert balances channel A (B) (R4927, R4928, R4929, R4931, R4992, R4993, R4994, R4996, signal unit).

- Switch channel A (B) on for vertical display.
- This adjustment is done in the service routine "Y-preamplifier test". Proceed as follows to come into this routine:
- \* Depress the channel A and B INVERT pushbuttons together in order to come into the service routine.
- \* Depress pushbutton A.
- \* Depress pushbutton A + B
- \* Depress pushbutton A(B) for adjustment of channel A(B). The change between A and B must be done via AUTO SET. The selected channel is switched continuously between normal and invert position.
- Adjust the channel A (B) input sensitivity to 500mV/div.
- Adjust R4927 (R4992) for minimal trace jump.
- Adjust the channel A (B) input sensitivity to 1V/div.
- Adjust R4928 (R4993) for minimal trace jump.
- Adjust the channel A (B) input sensitivity to 2V/div.
- Adjust R4929 (R4994) for minimal trace jump.
- Adjust the channel A (B) input sensitivity to 5V/div.
- Adjust R4931 (R4996) for minimal trace jump.
- Depress AUTO SET three times to leave the service routine.

Auto Set position channel A (B) (R5046, R5081 signal unit).

- Put the channel A and B position controls in their fully (anti) clockwise positions.
- Disconnect all input signals.
- Depress AUTO SET.
- Position channel A 0,2 div above the vertical mid of the screen with R5046.
- Position channel B 0,2 div under the vertical mid of the screen with R5081.

#### 25.3.6. Adjustment of low-frequency square-wave response of vertical attenuator unit of channel A (R6854, R6850, C6817, C6802).

NOTE: In this chapter the adjustments of channel B are mentioned between brackets behind those of channel A. It is advised to perform first the channel A adjustments. After that the adjustments for channel B must be done.

- Adjust the channel A (B) input sensitivity to 5 mV/div.
- Apply a calibrated square-wave signal of 1kHz/20 mV to the channel A (B) input.
- Adjust R6850A (B) for a straight pulse top.
- Adjust the channel A (B) input sensitivity to 2 mV/div.
- Apply a calibrated square-wave signal 1kHz/10 mV to the channel A (B) input.
- Adjust R6854A (B) for a straight pulse top.

- Adjust the channel A (B) input sensitivity to 50 mV/div.
- Apply a calibrated square-wave signal of 1kHz/200 mV to the channel A (B) input.
- Adjust C6817A (B) for a straight pulse top.
- Adjust the channel A (B) input sensitivity to 500 mV/div.
- Apply a calibrated square-wave signal of 1kHz/2 Volt to the channel A (B) input.
- Adjust C6802A (B) for a straight pulse top.

#### 25.3.7. Adjustment of time-base and final X-amplifier.

IMPORTANT: In order to minimise temperature effects, it is recommended for the time base and X-ampl. adjustments to position the instrument flat in the normal working position on your bench.

##### Final X-amplifier MAGN ON/OFF balance (R5720).

- Select MTB for X-deflection and AUTO mode.
- Apply a 1 msec time marker signal. MAIN TB sweep speed 200 microsec/div.
- Adjust the second time marker to the horizontal mid of the screen.
- Switch the TB MAGN off and check that the second time marker shows a minimal shift. If this is not obtained, readjust R5720 a little.

##### Main time base sweep times (R9536, R9531, R9703, C9117).

- Put the MAIN TB continuous control in the CAL position.
- Select MTB for horizontal deflection and AUTO mode.
- Select a MAIN TB sweep time of 10 microsec/div.
- Apply a 10 microsec. time marker pulse to input A. Select channel A for vertical display.
- Trigger the MAIN TB on channel A (AC-coupled).
- The function TB MAGN must be off.
- Adjust R9536 and the control X POS so that the 3rd and 9th marker pulse coincide exactly with the 3rd and 9th graticule line.
- Switch function TB MAGN on.
- Apply a 1 microsec. time marker pulse to input A.
- Adjust R9531 and control X POS so that the 3rd and 9th marker pulse coincide exactly with the 3rd and 9th graticule line. This must be valid over the total X-deflection range.
- Switch the function TB MAGN off.
- Apply 1 m.sec time marker pulse to input A.
- Select a MAIN TB sweep time of 1 m.sec/div.
- Adjust R9703 and the control X POS so that the 3rd and 9th time marker pulse coincide exactly with the 3rd and 9th graticule line.
- Apply a 100 n.sec time marker pulse to input A.
- Select a MAIN TB sweep time of 100 n.sec.

- Adjust C9117 and the control X POS so that the 3rd and 9th marker pulse coincide exactly with the 3rd and 9th graticule line.
- Note: the trimming potentiometers R9702 and R9704 need no adjustment.

Final X-amplifier linearity (C5702, C5713).

- Switch the function TB MAGN on.
- Select a MAIN TB sweep time of 2 n.sec/div.
- Adjust X POS so that the centre of the magnified sweep is in the centre of the screen.
- Apply a 2 n.sec time marker pulse to channel A.
- Check the linearity: the marker pulse in the horizontal mid of the screen must not deviate more than 0,18 div. if the marker at the begin deviates not more than 0.1 div and the marker at the end deviates not more than 0,25 div. If this is not obtained it may be corrected by readjusting C5702 and C5713 to a somewhat higher capacitance value. Both trimming capacitors must be increased with the same amount (must be turned over the same angle).

Delayed time base sweep times and X-deflection gain (R9847, R9803, C9216, R9541).

- Select DTB and MTB INTENS for horizontal display.
- Select function STARTS DTB.
- Put the DEL'D TB continuous control in the CAL position.
- Adjust the DELAY time to minimal: turn the control anti-clockwise until the value in the LCD does not change any longer.
- Select a MAIN TB sweep speed of 20 microsec/div.

- Select a DEL'D TB sweep speed of 10 microsec/div.
  - Apply a 10 microsec time marker signal.
  - Separate the MAIN TB and DEL'D TB displays with the TRACE SEP control so that they don't cover each other.
  - Adjust R9847 and control X POS so that the 3rd and 9th marker pulse of the DEL'D TB display (bottom of screen) coincide exactly with the 3rd and 9th graticule line.
- 
- Select a MAIN TB sweep speed of 2 m.sec/div.
  - Select a DEL'D TB sweep speed of 1 m.sec/div.
  - Apply a 1 m.sec time marker signal to input A.
  - Adjust R9803 and control X POS so that the 3rd and 9th marker pulse of the DEL'D TB display coincide exactly with the 3rd and 9th graticule line.
- 
- Select a MAIN TB sweep speed of 200 n.sec/div.
  - Select a DEL'D TB sweep speed of 100 n.sec/div.
  - Apply a 100 n.sec time marker signal to input A.
  - Adjust C9216 and control X POS so that the 3rd and 9th marker pulse of the DEL'D TB display coincide exactly with the 3rd and 9th graticule line.

Note: the trimming potentiometers R9802 and R9804 need no adjustment.

- Switch function TB MAGN off.
- Select MTB for horizontal display.
- Select a MAIN TB sweep speed of 20 microsec/div.
- Select channel A for vertical display.
- Select a channel A input sensitivity of 20 mV/div.
- Select channel A and AC-coupling for MAIN TB triggering.
- Apply a 10 kHz/120 mV calibrated sine-wave to channel A.
- Switch channel B on and channel A off.
- Select EXT X DEFL for horizontal display.
- Adjust R9541 for a horizontal deflection of 6 div.

#### DTB trace position adjustment (R9205/time base)

- Disconnect the input signal.
- Select MTB INTENTS and DTB for horizontal display.
- Adjust the DEL'D TB to a sweep speed of 10 us/div.
- Adjust the MAIN TB to a sweep speed of 10 us/div.
- Put the TRACE SEP control in its anti-clockwise position.
- Adjust R9205 to equal starting points of MTB INTENTS and DTB traces.

Delayed time base delay and delta T adjustments (R9348, R9347, R9346, R9344).

- Switch the READ OUT INTENSITY and the TRACE INTENSITY on.
- The now following adjustments must be done in the service routine "time base test". Proceed as follows to come into this routine:
- \* Depress the channel A and B INVERT pushbuttons together.
- \* Depress pushbutton A.
- \* Depress pushbutton B.
- Switch the READ OUT INTENSITY off.
- Apply a 10 $\mu$ s time marker signal to channel A.
- Depress vertical display pushbutton TRIG VIEW.
- Select a MAIN TB sweep speed of 10 microsec/div.
- Select a DEL'D TB sweep speed of 1 microsec/div.
- Adjust the control X POS so that the MAIN TB display starts exactly at the first vertical graticule line.
- Adjust R9348 so that the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and that the intensified part on the MAIN TB display starts after a delay of 2 div.
- Depress vertical display pushbutton A.
- Adjust R9347 so that the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and that the intensified part on the MAIN TB display starts after a delay of 8 div.
- Repeat the adjustments of R9348 (TRIG VIEW depressed) and R9347 (A depressed) a couple of times since they are interdependent.
- Depress vertical display pushbutton A+B.
- Adjust R9346 so that the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and that the intensified part on the MAIN TB display starts after a delay of 2 div. (Delay is 2 div; delta T is 0 div.)
- Depress vertical display pushbutton B.
- Adjust R9344 so that the first marker pulse of the DEL'D TB display coincides with the first vertical graticule line and that the 2nd intensified part on the MAIN TB display starts after a delay of 8 div. (Delay is 2 div.; delta T is 6 div.)
- Repeat the adjustments of R9346 (A+B depressed) and R9344 (B depressed) a couple of times since they are interdependent.
- Depress AUTO SET three times.

25.3.8. Adjustment of TRACE SEP balance on final Y amplifier (R4007)

- Select channel A for vertical display.
- Select "0" input coupling and an input sensitivity of 5 Volt/div for channel A.
- Select MTB INTENS and DTB for horizontal display.
- Select AUTO mode for MAIN TB.
- Adjust a MAIN TB sweep speed of 10 microsec/div.
- Adjust a DEL'D TB sweep speed of 1 microsec/div.
- Adjust a delay time of 050,00 microsec.
- Turn the TRACE SEP control fully clockwise.
- Adjust R 4007 so that the MAIN TB and DEL'D TB displays cover each other.

25.3.9. DEL'D TB start adjustment (C9387)

- Select channel A for vertical display and MAIN TB trigger source.
- Apply time marker pulses with a repetition rate of 200ns.
- Select ALT TB mode.

- Adjust X POS so that the MAIN TB display starts at the first vertical line of the graticule (in the MAIN TB sweep speed position of lms/div.)
- Select a MAIN TB sweep speed of 50ns/div.
- Select a DEL'D TB sweep speed of 20ns/div.
- Select TRIGerred mode for MAIN TB.
- Turn the MAIN TB LEVEL control fully anti-clockwise. After this turn it slowly clockwise until the instrument is just triggered.
- Adjust the delay time in the LCD to 175n.sec. (allowed deviation +or-12 nsec).
- Adjust C9387 so that on the DEL'D TB display the beginning of the rising edge of the time marker pulse coincides with the 2nd vertical graticule line.
- Adjust the delay time so that the beginning of the rising edge on the DEL,D TB display coincides with the 9th vertical graticule line
- Check if the delay time in the LCD has a value of 35nsec (+or-6 nsec).

25.3.10. Cursor adjustment (R5784, R5791, R5779, R5781, R5758, R5762, R5773, R4070).

- Switch the READ OUT INTENSITY on and the TRACE INTENSITIY off.
- The now following adjustments must be done in the service routine "final X/Z-amplifier test". Proceed as follows to come into this routine: depress the channel A and B INVERT pushbuttons together, then depress vertical display mode switch A, then ALT and then TRIG VIEW.
- Adjust R5779 so that both cursor lines are inside the screen area.
- Adjust R5773 so that both cursor lines cover each other.
- Depress vertical display mode pushbutton A.
- Adjust R5779 so that the left-hand cursor covers the graticule line in the mid of the screen.
- Adjust R5784 so that right-hand cursor covers the last right-hand graticule line. If necessary repeat the previous and this step.
- Depress vertical display mode pushbutton A+B.
- check if the cursor lines cover exactly the last left-hand graticule line and the last right-hand graticule line.  
Readjust R5779 and R5784 if required.
- Depress vertical display mode pushbutton B.
- Adjust R5781 so that the upper cursor covers the graticule line in the vertical mid of the screen.
- Adjust R5791 so that the lower cursor covers the last graticule line in the bottom of the screen. If necessary repeat the previous and this step.
- Install jumper X4013 again on the final Y-amplifier.
- Adjust R4070 on the final Y-amplifier so that the upper cursor covers the graticule line in the vertical mid of the screen.
- Depress vertical display mode pushbutton ALT.
- Check if the cursor lines cover the last graticule line in the top and the bottom of the screen. If necessary readjust R5791.
- Depress vertical display mode pushbutton CHOP.
- Adjust R5758 and R5762 so that the illuminated area lies symmetrically inside the graticule.
- Adjust R5709 so that the start of the first line of text (left top corner) coincides exactly with the other lines of text.

25.3.11. Square-wave response of final Y-amplifier (R4041, R4050, C4019, R4047, R4048, L4006, L4007, C5020/C5210/signal unit).

IMPORTANT:

In this part of the adjusting procedure the square-wave response of the instrument must be adjusted to minimal pulse distortion (aberrations) at maximal rise-time and bandwidth.

Before starting the adjustment it is important to be aware of the following:

- The aberrations specification is only valid if the rise-time of the input pulse is 1 nsec.  
As a rule, the pulse aberrations displayed on the CRT screen will increase if the rise-time of the input pulse is faster than 1 nsec. Consult the specification of the generator that you use and if necessary measure its rise-time. Only if the generator's rise-time is close to 1 nsec it may be used for checking oscilloscope's pulse aberrations specification.
- The adjustments are done via channel A. If the square-wave adjustments via channel A are completed, channel B must be checked. The adjustments via A are located on the final Y amplifier and thus also influencing the channel B performance. To compensate for this, channel B has one additional adjustment point C5020 on the signal unit. However, in some cases it is necessary to average between the response of channel A and B. The response of the TRIG VIEW channel can be adjusted with C5210 on the signal unit. In series with C5020 in channel B there is a resistor R5020 with a factory-selected value. Selection is done for obtaining equal pulse response in the vertical channels. During this adjustment procedure it is not necessary to change the value of R5020; this can only be necessary after replacement of one of the film circuits N4903 or N4967.
- The fast-rise output of the square-wave generator recommended in chapter 25.2./3 is able to deliver 1 Volt amplitude into 50 Ohm input impedance of the oscilloscope: this results in 5 div. signal in the 200 mV/div position of the attenuator. The adjustments are done in 200 mV/div. Afterwards it must be checked if the pulse aberration specification of + and - 5% can be obtained in 20 mV/div. For this the generator's output signal must be attenuated with an external 10:1 attenuator. The use of the amplitude control on the generator is not recommended since the aberrations in the output signal increase if this control is moved out of its max. position. Bear also in mind that the aberrations in the generator's output signal must be added to the aberrations of the oscilloscope if you judge the result on the CRT-screen.

Now proceed as follows:

- Adjust channel A to an input sensitivity of 200 mV/div.
- Select DC and 50 Ohm (generator termination) input coupling for channel A.
- Apply a 100 kHz/6 div. square-wave signal with a rise-time of 1 nsec. to the channel A input.
- Adjust the MAIN TB sweep speed to 2 us/div.
- Adjust the square-wave response with R4041

- Apply a 1 MHz/6 div. square-wave signal with a rise-time of 1 nsec. to the channel A input.
- Adjust the MAIN TB sweep speed to 20 ns/div.
- Adjust the square-wave response with R4050 and C4019 and the coils L4006 and L4007.
- Adjust the rise-time of the signal slope with R4047 and R4048.
- Now apply the generator signal to channel B (200 mV/div and selected as trigger source). Input switched to 50 Ohm and DC coupling.
- Try to optimise the square-wave response via channel B with C5020 on the signal unit. Do the same with C5210 for TRIG VIEW via the EXTERNAL trigger input. Adjust C5020 and C5210 so that the pulse responses of channel A, B and TRIG VIEW are as equal as possible.
- Check that the pulse aberrations via channel A and B in 20 mV/div do not exceed + and - 5%.  
The generator's output signal must be attenuated with an external 10:1 attenuator piece.
- Now the bandwidth of channel A (B) must be checked with a constant amplitude sine-wave generator.
- Apply a 50kHz/6 div. sine-wave signal from the constant amplitude generator to the channel A (B) input. The 6 divisions signal amplitude function as a reference.
- Check if the amplitude displayed on the screen does not become smaller than 4,3 div. over the frequency range from 50kHz up to 200 MHz. Check also that there are no dips in the frequency response.

25.3.12. Adjustment of gain, square-wave responses and balances of MAIN TB triggering on signal unit and MTB/DTB trigger input.

Trigger filter gain (R5191, R5192, R5169, R5216, C5210, signal unit)

- Apply a 2kHz/6 div. square wave signal to the channel A input (DC coupled). Input sensitivity: 200mV/div.
- Adjust the MAIN TB to a sweep speed of 200 us/div.

- Select channel A and TRIG VIEW for vertical display.
- Select DC for the MAIN TB triggering.
- Adjust the MAIN TB LEVEL control to a triggered display. Triggering on channel A.
- Adjust R5169 so that the shape of the square-wave displayed via TRIG VIEW is equal to the channel A display.
- Adjust R5216 so that the amplitude of the square-wave displayed via TRIG VIEW is equal to the channel A display.
- Increase the frequency of the square-wave signal applied to channel A to 1 MHz (rise-time  $\leq 1$  ns).
- Adjust the MAIN TB to a sweep speed of 20 ns/div.
- Adjust R5191 so that the shape of the square-wave displayed via TRIG VIEW is equal to the channel A display.
- Adjust the MAIN TB to a sweep speed of 10 ns/div.
- Adjust R5192 and C5210 so that the shape of the square-wave displayed via TRIG VIEW is equal to the channel A display.

Trigger view gain via external input (R5127, signal unit).

- Select EXT as MAIN TB trigger source together with DC-coupling.
- Switch the BW LIMIT function on.
- Apply a 2 kHz/0,5 Volt calibrated square-wave signal to the MTB TRIG or X DEFL input.
- Adjust the MAIN TB sweep speed to 200 microsec/div.
- Adjust the signal amplitude to 5 div. with R5127.

LF-square-wave response MTB/DTB trigger input (R4751, R4753).

- Adjust the square-wave response to minimal overshoot with R4751.
- Increase the generator output voltage from 0,5 to 5 Volt.
- Select EXT:10 as MAIN TB trigger source.
- Adjust the square-wave response to minimal overshoot with R4753.

MTB trigger filter offset (R5144, signal unit).

- Adjust the channel B input sensitivity to 20mV/div.
- Apply a 1 kHz/0,1 Volt square-wave signal to the channel B input.
- Select AC input coupling for channel B.
- Switch BW LIMIT on.
- Select TRIG VIEW for vertical deflection.
- Select B as MAIN TB trigger source.
- Select TRIG mode (adjust MAIN TB LEVEL) for the MAIN TB and a sweep time of 200 microsec/div.
- Adjust R5144 to minimal trace jump when switching between AC and DC trigger coupling.

MTB AUTO peak-peak sensitivity (R5197, signal unit).

- Depress input coupling pushbutton "0" of channel B.
- Select AUTO mode for the MAIN TB.
- Select DC trigger coupling for the MAIN TB.
- Adjust R5197 so that the trace does not move when operating the MAIN TB LEVEL control between its extreme positions.

MAIN TB SLOPE, trigger gap and AUTO SET (R5208, R5201, R5079 signal unit).

- Select channel A for vertical display.

- Apply a 2 kHz/6 div. sine-wave signal to the channel A input (DC-coupled).
- Trigger the MAIN TB on channel A. Filter section must be DC-coupled.
- Depress AUTO of the MAIN TB mode selector.
- Put the MAIN TB LEVEL control exactly in its mid position.
- Operate the SLOPE switch continuously and adjust R5208 to a vertical distance of 0,2 div. between the start of the positive and negative slope.
- Decrease the signal amplitude to 2 div.
- Operate the SLOPE switch continuously and adjust R5201 to the situation that the trigger points of the positive and negative slope are symmetrical around the vertical mid of the screen.
- Repeat the adjustment of R5201 also with a signal amplitude of 0,8 div.
- Decrease the signal amplitude to 0,4 div.
- Operate the SLOPE switch continuously and readjust R5208 and R5201 so that the signal stays triggered.
- Depress AUTO SET.
- Readjust -if necessary- the MAIN TB sweep speed and channel A Y AMPL to a well-visible waveform on the screen.
- Depress pushbutton TRIG of the MAIN TB mode selector.
- Adjust R5079 to a starting point of the signal at 1,2 div. above the vertical mid of the screen.

Trigger view balance (R5041, signal unit).

- Select "0" input coupling for channel B.
- Select TRIG VIEW for vertical deflection.
- Position the trace in the vertical mid of screen by means of R5041.

25.3.13. Adjustment of gain, square-wave responses and balances of DEL'D TB triggering on signal unit and MTB/DTB trigger input.

Y-out filter gain (R5276, R5304, R5269)

- Connect the Y-output signal to the channel B input socket.
- Adjust channel B to an input sensitivity of 10mV/div. and 50 Ohm input impedance.
- Select channel A and B for vertical display.
- Depress pushbutton AUTO of the MAIN TB mode selector.
- Trigger the DEL'D TB on channel A with AC-coupled filter.
- Adjust the MAIN TB to a sweep of 100us/div.
- Trigger the MAIN TB on channel A with AC-coupled filter.
- Apply a 2 kHz/6 div. square-wave signal to the channel A input (DC-coupled).
- Adjust R5269 so that the shape of the square-wave displayed via channel B is equal to the channel A display.
- Adjust R5304 so that the amplitude of the square-wave displayed via channel B is equal to the channel A display.
- Increase the frequency of the square-wave signal applied to channel A to 1 MHz (rise-time  $\leq 1$ ns).
- Adjust the MAIN TB to a sweep speed of 20 ns/div.
- Adjust R5276 so that the shape of the square-wave (pulse top) displayed via channel B is equal to the channel A display.

- Connect the Y-output signal to the channel A input socket.
- Adjust channel A to an input sensitivity of 10 mV/div. and 50 Ohm input impedance.
- Select channel A for vertical display.
- Apply a 2 kHz/500 mV square-wave signal to the EXTERNAL trigger input of the DEL'D TB.
- Select the EXTERNAL trigger input as DEL'D TB trigger source.
- Adjust the MAIN TB to a sweep speed of 200 us/div.
- Adjust R5227 so that 5 div. of amplitude are displayed.

#### LF-square-wave response MTB/DTB trigger unit (R4851, R4853)

- Adjust the square-wave response to minimal overshoot with R4851.
- Increase the generator output voltage from 0,5 to 5 Volt.
- Select EXT:10 as DEL'D TB trigger source.
- Adjust the square-wave response to minimal overshoot with R4853.

#### DTB trigger filter offset (R5244, signal unit).

- Adjust the channel B input sensitivity to 20mV/div.
- Apply a 1 kHz/0,1 Volt square-wave signal to the channel B input.
- Select AC input coupling for channel B and switch the 50 Ohm off.
- Switch BW LIMIT on.
- Select B as DEL'D TB trigger source.
- Select TRIG mode (adjust MAIN TB LEVEL) for the MAIN TB and a sweep time of 200 microsec/div.
- Adjust R5244 to minimal trace jump when switching between AC and DC trigger coupling of the DEL'D TB triggering.

#### DEL'D TB SLOPE and trigger gap (R5292, R5296 signal unit).

- Put the DEL'D TB LEVEL control in its mid position: check that the voltage tag X5363 is +5 Volt.
- Select AUTO mode for the MAIN TB (sweep speed 200 us/div).
- Select channel B for vertical deflection (channel A off).
- Select input coupling mode "0" for channel B.
- Position the channel B trace in the vertical mid of the screen.
- Select input coupling mode "DC" for channel B and apply a 1 kHz/6 div. sine-wave signal to the channel B input.
- Connect the Y output signal to the channel A input (10 mV/div).
- Select channel A for vertical display. Switch channel B off.
- Select the channel A DC and 50 Ohm input coupling.
- Switch the BW LIMIT function on.
- Select MAIN TB triggering on channel A (DC coupled).
- Select TRIG DTB and select DEL'D TB triggering via channel B (DC-coupled).
- Operate the DEL'D TB SLOPE switch constantly and adjust the starting point of the trace symmetrically around the screen mid with R5292.
- Operate the MAIN TB SLOPE switch constantly and adjust R5296 so that the vertical distance between the start of the signal at positive and negative SLOPE is + or - 0,3 div.

LEVEL compensation adjustment Y-out (R5310, signal unit).

- Adjust R5310 for minimal trace jump when operating the DEL'D TB LEVEL control.

LEVEL offset adjustment Y-out (R5311, signal unit).

- Select channel B for vertical display. Switch channel A off.
- Select "0" input coupling for channel B and position the channel B trace in the vertical mid of the screen.
- connect the Y-output signal to channel B.
- Select DC and 50 Ohm input coupling for channel B.
- Select TRIG DTB and select DEL'D TB triggering via channel A (DC coupled).
- Select "0" input coupling for channel A.
- Position the trace in the vertical mid of the screen with R5311.

25.3.14. Calibration voltage adjustment (R7321, mother board)

Check that the amplitude of the calibration signal lies between 0 Volt and +0,8 Volt ( +/- 1%). This results in a read-out of 400 mV on a digital AC-millivoltmeter (duty-cycle of cal. voltage is 50%). If not, readjust R7321.

## 26. CORRECTIVE MAINTENANCE

### 26.1 REPLACEMENTS

WARNING: When the EHT cable to the post acceleration anode is disconnected, the cable must be discharged by shortening the terminal to the instrument's earth.

#### 26.1.1. Standard parts

Electrical and mechanical replacement parts can be obtained through your local Philips organisation or representative. However, many of the standard electronic components can be obtained from other local suppliers. Before purchasing or ordering replacement parts, check the parts list for value, tolerance, rating and description.

NOTE: Physical size and shape of a component may affect the instrument's performance, particularly at high frequencies. Always use direct-replacement components, unless it is known that a substitute will not degrade the instrument's performance.

#### 26.1.2. Special parts

In addition to the standard electronic components, some special components are used:

- Components, manufactured or selected by Philips to meet specific performance requirements.
- Components which are important for the safety of the instrument.

ATTENTION: Both type of components may only be replaced by components obtained through your local Philips organisation or representative.

#### 26.1.3. Transistors and Integrated Circuits

- Return transistors and I.C.'s to their original positions, if removed during routine maintenance.
- Do not renew or switch semi-conductor devices unnecessary, as it may affect the calibration of the instrument.
- Any replacement component should be of the original type or a direct replacement. Bend the leads to fit the socket or pcb-holes and cut the leads to the same length as on the component being renewed.
- When a device has been renewed, check the operation of the part of the instrument, that may be affected.
- When re-installing power-supply transistors, use silicon grease to increase the heat-transfer capabilities.

WARNING: Handle silicon grease with care. Avoid contact with the eyes. Wash hands thoroughly after use.

#### 26.1.4. Static sensitive components

This instrument contains electrical components that are susceptible to damage from static discharge. Servicing static-sensitive assemblies or components should be performed only at a static-free work station by qualified service personnel.

Fig.26.1.Exploded view of front unit.

#### 26.1.5. Handling MOS devices

Through all our MOS integrated circuits incorporate protection against electrostatic discharges, they can nevertheless be damaged by accidental over-voltages. In storing and handling them, the following precautions are recommended.

CAUTION: Testing or handling and mounting call for special attention to personal safety. Personnel handling MOS devices should normally be connected to ground via a resistor.

##### 26.1.5.1 Storage and transport

Store and transport the circuits in their original packing. Alternatively, use may be made of a conductive material or a special IC carrier that either short-circuits all leads or insulates them from external contact.

##### 26.1.5.2 Testing or handling

Work on a conductive surface (e.g. metal table top) when testing the circuits or transferring them from one carrier to another. Electrically connect the person doing the testing or handling to the conductive surface, for example by a metal bracelet and a conductive cord to a chain. Connect all testing and handling equipment to the same surface. Signals should not be applied to the same surface. Signals should not be applied to the inputs while the device power supply is off. All unused input leads should be connected either to the supply voltage or to ground.

##### 26.1.5.3 Mounting

Mount MOS integrated circuits on printed circuit boards after all other components have been mounted. Take care that the circuits themselves, metal parts of the board, mounting tools, and the person doing the mounting are kept at the same electric (ground) potential. If it is impossible to ground the printed-circuit board, the person mounting the circuits should touch the board before bringing the MOS circuits into contact with it.

##### 26.1.5.4 Soldering

Soldering iron tips, including those of low voltage irons, or soldering baths should also be kept at the same potential as the MOS circuits and the board.

##### 26.1.5.5 Static charges

Dress personnel in clothing of non-electrostatic material (no wool, silk or synthetic fibres). After the MOS circuits have been mounted, the proper handling precautions should still be observed. Until the sub-assemblies are inserted into the complete system in which the proper voltages are supplied, the board is not more than an extension of the leads of the devices mounted on the board. To prevent static charges from being transmitted through the board wiring to the device it is recommended that conductive clips or conductive tape is put on the circuit board terminals.

#### 26.1.5.6 Transient voltages

To prevent permanent damage due to transfer voltages, do not insert or remove MOS devices, or printed circuit boards with MOS devices, from test sockets or systems with power on.

#### 26.1.5.7 Voltage surges

Beware of voltage surges due to switching electrical equipment ON or OFF, relays and d.c. lines.

#### 26.1.6. Replacing knobs

NOTE: fig.26.1. shows the exploded view of the front unit. The numbers mentioned between brackets in this text refer to the item numbers given in the exploded view.

- take off the knob covers (3,5). When reinstalling knob covers with a dashed line take care that the dashed line is in its correct position.
- the internal fixation screw in the small knobs (4) can be slackened with a screwdriver: after this the knob can be taken off.
- the bigger knobs (2) have an internal fixation nut that can be slackened with a pair of pliers: after this the knob can be taken off.

#### 26.1.7. Removing the printed circuit boards and their mounting plates and the CRT.

NOTE: during installation, work in reversed sequence.

##### 26.1.7.1 Printed circuit boards of the front unit and text plate.

Fig.26.1. shows the exploded view of the front unit. The numbers mentioned between brackets in this text refer to the item numbers given in the exploded view.

##### Front unit

- Remove the six screws in the top cover plate of the unit. The removal of this top cover plate is necessary to reach the flatcables that are plugged on to the unit.
- Remove the two screws that fix the front unit to the bottom side of the front profile.
- Unplug the flatcables at the central processor unit, CRT text unit and the IEEE-unit.
- Unplug a coaxial cable from the text unit.
- Now the unit can be slid out of the front profile of the instrument.

IMPORTANT: after the above actions, the front unit can be connected again in order to measure it under working conditions. The best way to do this (see fig.26.2. part 1) is to put the instrument on its left side panel and to put the front unit in its normal position close to the instrument: now the flatcables and the coaxial cable are just long enough to reach their connectors at the front unit.

IEEE unit (unit A271, Optional)

- Take the front unit out of the instrument
- Unplug the flatcable coming from the intermediate unit
- Remove 2 screws (26) and 2 hexagonal spacers (bottom side).
- The IEEE unit can now be separated from the CRT text unit. This must be done very carefully in order to prevent that the interconnecting contact pins are bent. Also the installation of the unit must be done very carefully.

PART 1

PART 2

Fig.26.2. Measuring the front unit and power supplies under working conditions.

NOTE: after this action the component side of the CRT text unit is visible.

#### CRT text unit (unit A281)

- Take the frontunit out of the instrument.
- Remove the IEEE unit.
- Remove four hexagonal spacers (27).
- The CRT text unit can now be separated from the central processor unit. This must be done very carefully in order to prevent that the interconnecting contact pins are bent. Also the installation of the unit must be done very carefully.

NOTE: after this action the component side of the central processor unit is visible.

#### Central processor unit (unit A 1085)

- Take the front unit out of the instrument.
- Remove the IEEE unit.
- Remove the CRT unit.
- Remove four hexagonal spacers (30).
- The central processor unit can now be separated from the intermediate unit. This must be done very carefully in order to prevent that the interconnecting contact pins are bent. Also the installation of the unit must be done very carefully.

#### Text plate

- Remove the front unit.
- Take off the knob covers (3,5). When reinstalling knob covers with dashed line take care that the dashed line is in its correct position!
- The internal fixation screw in the small knobs (4) can be slackened with a screwdriver: after this the knob can be taken off.
- The bigger knobs (2) have an internal fixation nut that can be slackened with a pair of pliers: after this the knob can be taken off.
- The text plate (7) can be removed after having removed six slotted nuts (6) behind the knobs Ch.A position, level MTB, level DTB, var Ch.A, var MTB and var DTB. For this job a special tool is available under service code number 5322 395 54024. For those who want to make this tool in a local workshop, a dimensional drawing is given in fig. 26.3.

MAT 139

Fig.26.3. Dimensional drawing of tool for slotted nut.

LCD unit (unit A 1011)

- Take front unit out of instrument.
- Remove text plate and knobs.
- The LCD-unit can be separated from the front unit after having removed three nuts (13) under the controls Ch.A Y-ampl., DEL'D TB and MAIN TB. This must be done very carefully in order to prevent that the interconnecting contact pins are bent. Also the installation of the unit must be done very carefully.

Removal of an LCD:

- Slide the plastic plate (15) off at the rear side of the p.c.b.(14).
- Now the transparent box (9) can be separated from the p.c.b. This box contains two contact rubbers (12), a plastic spacer (11) and the LC-display (10). The rubbers and the LCD must be handled very carefully and must be kept away from dirt (such as grease) in order to assure good contact capabilities.

NOTE: after the removal of the LCD-unit, the component side of the intermediate unit is visible.

Switch unit (unit A 1031)

- Remove the knobs and text plate.
- Remove six hexagonal spacers (8) that are present around the shafts of the potentiometers Ch.A pos, level MTB, level DTB, var. Ch. A, var MTB and var DTB.
- Now the switch unit (17) together with the LCD unit (14) can be removed. The LCD-unit can be separated from the switch unit after having removed three nuts (13) that are present around the shafts of the controls Ch. A Y ampl., DEL'D TB and MAIN TB.

NOTE: the pushbutton switches (1) with incorporated LED must be replaced as a complete unit.

removal of an impulse switch (19) and infra-red LED (18):

- Remove the LCD-unit (see description above).
- Remove the hexagonal (spacer) nut (16) that fixes the impulse switch unit to the p.c.b.
- Now the impulse switch unit can be taken backwards out of the unit.
- Now the two infra-red LED's (18) of the switch can be reached for replacement.

NOTE: when reinstalling a new infra-red LED, take care of the correct position of this device compared with the impulse switch unit. For this it is advised first to mount the LED without soldering it. Then the impulse switch must be installed. Now check that the LED fits correctly in the impulse switch and solder it.

Intermediate unit (unit A 1061)

- Remove the knobs and text plate.
- Remove the switch unit (together with LCD unit).
- Remove four screws (24) and the unit can be separated from the central processor unit.
- Potentiometers (23) can be interchanged after removal of its hexagonal (spacer) nut (20). After installation of a new potentiometer it is advised first to fix it with the nut. After this its pins must be soldered to the unit: this assures correct positioning.

NOTE: when reinstalling a new photo-sensitive transistor (22), take care of the correct position of this device compared with the impulse switch unit on the switch unit. Therefore it is advised to solder the photo-transistor to the p.c.b. after having checked its position compared with the impulse switch unit. For this it is necessary to fix the intermediate unit and the switch unit together.

#### 26.1.7.2 Time base unit (unit A201)

- Unplug all the coaxial cables.
- Remove the small p.c.b. from time base unit and also the underlaying spacer. When reinstalling the small p.c.b., take care that its contact pins fit correctly in the connectors at the time base unit so that these pins are not bent.
- Remove the fixation screws of the unit.
- Slide the unit sideways out of the connectors at the motherboard.

#### 26.1.7.3 X/Z amplifier (unit A 2116)

WARNING: Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Unplug very carefully the two output wires from the X/Z amplifier. These wires have small connectors that fit on the side connection pins of the CRT.- Unplug the coaxial cables.
- Remove the six screws that mount the unit to its mounting plate.
- Slide the p.c.b. carefully out of its connector on the motherboard.
- Unplug the multipole connector that comes from the CRT-socket.

NOTE: the mounting plate of this p.c.b. can be removed after having removed the two screws that fix it to the instrument's rear panel.

#### 26.1.7.4 Final Y amplifier (unit A1716)

- Unscrew the earth and signal clamps of the delay line cable.
- Unplug a coaxial cable.
- Unplug the flatcable coming from the motherboard.
- Remove the three nuts that attach the film circuits of the p.c.b. to the underlaying mounting plate.
- Remove the X/Z amplifier together with its mounting plate (see chapter 26.1.7.3).

WARNING: Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Unplug very carefully the four output wires from the final Y amplifier. These wires have small connectors that fit on the side connection pins of the CRT.
- Remove the two remaining screws that attach the p.c.b. to its mounting plate.

NOTE: the mounting plate for this p.c.b. can be separated from the chassis after having removed its four mounting screws.

## 26.1.7.5 Signal unit (unit A1511)

- Remove all the coaxial cables from their sockets.
- Unscrew the earth and signal clamps of the delay line cable.
- Remove the screws that fix the p.c.b. to the instrument's chassis.
- Lift the p.c.b. upwards from the instrument. This is necessary because the unit has contact pins that fit into a connector at the mother board. In order to protect these contact pins, the mother board is equipped with guidance pins.

## 26.1.7.6 CRT control unit (unit A222)

- Unplug a connector with flat-cable.
- Unplug a three-pole connector.
- The complete unit can be taken out of instrument after having removed two screws in the front-profile of instrument.

For exchange of a potentiometer proceed as follows:

- Remove the four nuts that attach the potentiometer to the bracket.
- Separate bracket from p.c.b. by removing 2 screws.
- Solder potentiometer out of p.c.b.
- Put the new potentiometer in the p.c.b. (without soldering it).
- Mount the bracket to the p.c.b. (with two screws and four potentiometer nuts)
- Now the potentiometer is positioned correctly, it can be soldered on to the p.c.b.

## 26.1.7.7 Graticule illumination lamps

- Can be reached after removal of the CRT control unit (see chapter 26.1.7.6.)
- The two lamps are fixed in plastic lamp holders. Every lampholder fits in a plastic light-conductor with two clamping springs. These clamping springs are parts of the lampholder.

## 26.1.7.8 Delay line cable

- Remove the front unit (see chapter 26.1.7.1.)
- Unscrew the earth and signal clamps at both ends of the cable at the signal unit and the final Y amplifier.
- Unscrew the plastic clamps that fix the cable to the instrument's chassis.
- Remove the two nuts that fix the cable holder to the power supply compartment; these nuts can be reached via the space in which the front unit fits.

## 26.1.7.9 Power supplies

Opening the power supply compartment

WARNING: inside the power supply compartment there are many parts that carry dangerous high voltages. Some of these voltages stay some time after disconnecting the instrument from the mains. Therefore it is recommended to wait at least five minutes after having disconnected the instrument from the mains, before opening the compartment. If working on the power supplies under working condition cannot be avoided, it must be done by a qualified technician who is aware of the dangers involved.

now proceed as follows:

- Switch the instrument off and disconnect it from the mains voltage.
- Remove the screws from the rear panel with mounting plate for the power supplies. Some of these screws have spring washers that assure a good interconnection of the safety earth to the instrument's chassis. Don't forget to remount them in their original position!
- Remove the rear panel that covers the CRT-socket.
- Remove the support for the EHT-cable. This support is located close to the final Y-amplifier.
- Unplug the multipole connector from the motherboard.
- Unplug three single wire connectors from the CRT socket p.c.b..  
Remember the position of the wires for correct reinstallation.
- Now the unit can be slid out of the instrument.

NOTE: The power supplies can be measured under working condition if the mounting plate with the power supplies is positioned behind the instrument according to figure 26.2/part 2. In the positions indicated in the figure, the wiring is long enough to be reconnected to mother board and CRT-socket. The figure gives the position for access to primary converters and high voltage converter. With the instrument and the mounting plate upside down, the secondary converter is accessible.

#### Primary converter units (unit A2315)

- Unsolder the wires from the unit that has to be exchanged.  
Remember the position of these wires in order to assure correct reinstallation.
- Remove two screws per converter unit and it can be slid out of its mounting plate.

#### High voltage converter (unit A2350)

- Unsolder the two wires that are going to the EHT multiplier unit.
- Unplug one single-wire connector going to the CRT-socket.
- Unplug one multipin socket.
- Remove six mounting screws and the p.c.b. can be separated from its mounting plate.

#### Secondary converter unit (unit A2320)

- Unplug four multipole connectors.
- Unplug two single-pole connectors going to the CRT-sockets. Remember the position of these wires in order to assure correct reinstallation.
- Unsolder the two wires from the EHT-multiplier unit at the high voltage converter (unit A2350).
- Unscrew the bracket for the EHT-cable.
- Remove the two hexagonal spacers under this bracket.

WARNING: The EHT-cable is unbreakably connected to the CRT. The cable can be disconnected from the EHT multiplier unit. When the EHT-cable is disconnected from the EHT multiplier unit the end of the cable must be discharged immediately by shorting it to the instrument's earth.

- Unscrew the plastic nut from the EHT multiplier unit, pull the EHT-cable out of the EHT multiplier unit and short-circuit its end to the instrument's earth.
- Unscrew the fixation screws of the p.c.b., after this the unit can be separated from its mounting plate.

NOTE: the EHT-multiplier unit can be separated from the secondary converter p.c.b.. The unit is fixed with a metal bracket; this bracket is fixed with one screw.

Fig 26.4. Exploded view of attenuator unit.

## 26.1.7.10 Mother Board (unit A2421)

- Remove the X/Z amplifier together with its mounting plate. See chapter 26.1.7.3.

**WARNING:** Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Remove very carefully the four side connections coming from the final Y-amplifier. These side connection wires have small connectors that fit on the side connection pins of the CRT.
- Unplug the flatcable from the final Y-amplifier.
- Remove the left side panel from the instrument: it is fixed with seven screws.
- Remove the screw in the spacer of the EHT-cable situated in the vicinity of the final Y-amplifier.
- Now the side panel can be moved so that the eight screws in the mother board (for screws at the top side and four at the bottom side) can be reached with a screwdriver with a long shaft.
- Remove the nut and spring-washer from power transistor V7311.

**NOTE:** for replacement of V7311 it is not necessary to remove the mother board. It is required then to remove the X/Z amplifier and its mounting plate and the nut and spring washer in V7311. Then its pins can be desoldered one by one. For mounting of the new transistor you have to work in reversed sequence: the pins of the new transistor must be cut to the required length.

- Remove the time base unit (see chapter 26.1.7.2.)
- Remove the top cover plate from the front unit and unplug the flatcables.
- Unsolder three leads coming from the CRT (trace rotation).
- Unplug the connectors coming from the power supply and the battery holder.
- Unplug the flatcable that comes from the CRT control unit.
- Unplug the flatcable from the adaptation unit.
- Unplug the coaxial cable for the calibration voltage.
- Unplug the connector for the graticule illumination lamps.
- Slide the motherboard upwards out of the connector on the signal unit.

## 26.1.7.11 Vertical attenuator, external MTB/DTB trigger input and adaptation unit.

Removal of mounting plate.

On this mounting plate the channel A and B attenuators, the MTB/DTB external trigger input and the adaptation unit are mounted. The plate can be separated from the instrument as follows:

- Unplug the flatcable coming from the motherboard.
- Unplug four coaxial cables.
- Unscrew six screws of which there are two present in the left and two in the right side panel of the front compartment. The remaining two screws are also used to fix the front unit to the instrument's front profile.

**IMPORTANT:** after the above actions, the units can be separated from their mounting plate. Every input unit is fixed to the mounting plate with a pair of small screws that are present in holes in the plate. After reinstallation of an input unit it is recommended not to tighten its two mounting screws until the BNC input socket fits again into the text plate: this assures a correct positioning of the unit.

Removal and dismantling of external trigger input (unit A1311)

- Remove two small screws that fix the unit to its mounting plate.
- Slide the unit out of its connector on the adaptation unit: this must be done very carefully in order to prevent that the contact pins of the unit are bent. Also the installation of the unit must be done very carefully.
- The shielding can be slid from the unit after removal of one screw.
- The p.c.b. is mounted in its holder with four screws: before removing the p.c.b., the earth tags (four per BNC) of the BNC's must be unsoldered from the p.c.b.. Also the wire between the BNC signal tag and the bracket with the input capacitors must be unsoldered: this must be done very quickly and close to the BNC in order to avoid that the input capacitors get too hot. The BNC-socket can be separated from the bracket with a special tool that fits on the slotted nut of the BNC. This tool is available under service code number 5322 395 54023. For those who want to make this tool in a local workshop, a dimensional drawing is given in fig.26.5.

Fig.26.5. Dimensional drawing of tool for BNC input sockets.

Removal and dismantling of vertical attenuator

- Remove two small screws that fix the unit to its mounting plate.
- Slide the unit out of its connector on the adaptation unit: this must be done very carefully in order to prevent that the contact pins of the unit are bent. Also the installation of the unit must be done very carefully.
- Slide the shielding can from the unit. The unit can be plugged into its connector on the adaptation unit again. The LF-p.c.b. (unit A1116) can be measured now under working conditions if the wiring is reconnected again.

**IMPORTANT:** it is strongly recommended to take notice of this chapter and belonging figure 26.4. before starting the job.

- Put the unit on your bench with the LF-p.c.b upwards and unsolder the four screening cans (10) from the tags of the earth bracket (2A).
- Unsolder the wire of the probe indicator from the soldering tag on the LF-p.c.b. Put the unit on your bench with the HF-p.c.b. upwards and unsolder the two tags (2B) of the input earth bracket from earth bracket (17).
- Remove two screws that attach the p.c.b.'s to their mounting bracket.
- Put the unit on your bench with the HF-p.c.b. upwards and unsolder the BNC-signal tag (13) from the bracket with the input capacitors (5): this must be done very quickly and close to the BNC in order to avoid that the input capacitors get too hot.
- The subassembly consisting of the LF and HF p.c.b. can be slid out of the mounting bracket.

**NOTE:** after the above actions, the 50 Ohm termination resistor array on the HF-p.c.b. can be interchanged.

- The BNC-socket can be separated from the bracket with a special tool that fits on the slotted nut (4) of the BNC. This tool is available under service code number 5322 395 54023. For those who want to make this tool in a local workshop, a dimensional drawing is given in fig. 7.4. Together with the removal of the BNC all the separate parts (2), (3), (4), (13), and (14) can be taken apart.
- If you want to separate the HF (11) and LF (7) p.c.b's, it is necessary to remove the glass reed switches from their coils. For this purpose the bracket with the input capacitors (5) must be unsoldered from the reed relays. After this the other side of the reed relay can be unsoldered from the HF-p.c.b. and it can be slid out of the coil. Also the resistor between the bracket and the LF-p.c.b. must be unsoldered at the LF-p.c.b. Now the hardware (4x) that fixes the HF and LF p.c.b. together (9,8,12) can be removed and the HF-p.c.b. (11) with its four screening cans (10) can be slid out of the reed relay coils (6) on the LF-p.c.b. (7).

#### Removal of adaptation unit (unit A2312).

- Remove the two vertical attenuator units.
- Remove the external trigger input unit.
- Remove the three screws that fix the adaptation unit to its mounting plate.
- The unit can now be separated from the mounting plate.

**IMPORTANT:** All sides of the input units can be measured under working condition. For this all four units must be removed from their mounting plate. The shield of the suspected unit must be removed. After this, the units can be plugged into the adaptation unit again and after reinstallation of the wiring (flatcable and four coaxial cables) the units function again.

### 26.1.7.12 Replacement of CRT (cathode ray tube).

**IMPORTANT:** It is strongly recommended to take notice of this chapter and belonging figure 26.6. before starting the job. Bear in mind that there are slight differences between PM328.. and PM329.. Where it happens, it is indicated.

#### Removing the CRT from the instrument.

- Remove the X/Z-amplifier together with its mounting plate. See chapter 26.1.7.3.

**WARNING:** Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Remove very carefully the side connections coming from the final Y-amplifier. These connection wires have small connectors that fit on the side connection pins of the CRT.
- Remove the earth connection wires from the front and rear CRT shields.
- Remove the rear plate that covers the CRT socket and take the p.c.b. at the CRT socket off.
- Open the power supply compartment. In PM329.. the EHT-cable can only be removed at the EHT multiplier. This part is present in the power supply compartment that must be opened for CRT removal. In PM328.. however the EHT-cable can also be removed at the CRT-side. Therefore it is not necessary to open the power supply compartment when exchanging a CRT. See chapter 26.1.7.9.

**WARNING:** When the EHT-cable is disconnected from the EHT multiplier unit or the CRT in PM328.., the end of the cable must be discharged immediately by shorting it to the instruments earth.

- Remove the EHT-cable from the bracket on the secondary converter unit, disconnect it from the EHT multiplier unit and discharge it.
- Take the bezel and contrast filter off: for this grip the left and right hand side between each thumb and fore finger and pull it gently forward (if necessary, insert the finger-nails in slots to ease it free).
- Slacken the hexagon screws (1), (2) and (4) that position the CRT-screen. Screws (1) and (2) attach the pressure bar on top of the screen.
- Remove the two screws that attach the rear support (14) of the CRT to the instrument's chassis. For this you have to use a screwdriver with a long shaft.
- Now the CRT can be lifted upwards out of the instrument.
- Remove the mounting material (13) and (15) that attaches the rear support (14) to the clamping bracelet (17).
- Remove the clamping bracelet.

**WARNING:** Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Slide the rear shield (19) backwards from the CRT and be careful not to hit the CRT side connections.
- Remove the rubber ring (20) from the CRT.
- Click the front shield (12) out of its two plastic clamping springs (11).
- Now the CRT and its plastic positioning ring (10) are left. The position of this ring is very important since it determines the

position of front and rear shield. So before taking the ring off from the CRT you have to look very carefully how it is mounted in order to be able to remount it correctly on the new CRT. The ring can be removed with two screws (7A=PM328. and 7B=PM329. situation).

#### Installing the new CRT.

- Install the positioning ring (10) so that the end of the positioning tags (7B, PM329.) or the indication line on the tags (7A, PM328.) are at the same level as the side connection pins of the CRT (see fig 26.6.). The position of the clamping springs (11) must be so, that the front shield (12) fits correctly into them. When doing this, take care of the correct positioning of the EHT-cable (8) and the trace rotation wires and mount the plastic rim (6). For PM329. the earthing bracket (21) for protection tube F1 must be positioned under ring (10). This bracket also earthen the CRT.
- Put the rubber ring (20) around the CRT. The distance (9) between the ring and the end of the CRT-screen must be 31 cm for PM329. and 26 cm for PM328..

**WARNING:** Handle the CRT carefully. Rough handling or scratching can cause the CRT to implode. In particular be very careful with the side connections of the CRT. If these pins are bent the CRT is likely to develop a loss of vacuum.

- Slide the rear shield (19) into the front shield until it touches the positioning ring. The position of the rear shield must be so that all the CRT's side connections are visible through the square holes (18) in the shield.
- Put the bracelet (17) and the CRT rear support (14) around the rear shield and mount the fixing material in hole (15) of the rear support without tightening it. The result is that the bracelet and rear support can be slid along the rear shield.
- Now the CRT can be put into the instrument. The screen must touch the front plate (5). The horizontal positioning part (4) and the top positioning parts (1) and (2) must be fixed (with their hexagon screws) so that the CRT is pressed into the fixed positioning part (3). The variable positioning parts can be pressed with a screwdriver via the belonging holes in the front plate; after that they are secured with the belonging hexagon screw.
- Now the CRT rear support can be positioned and fixed to the chassis (2 screws).
- After this the bracelet can be fixed with the mounting material (13), (15) and (16).
- Now the steps mentioned under "removing the CRT ..." must be completed in reversed sequence in order to complete the job.

#### Removal of carrying handle

See fig. 28.3 for location and itemnumber of parts.

- Remove both fixing rings and washers (7) and the handle can be separated from the cabinet. When installing the handle again, the fixing pin (8) can be pulled out of the handle arm with a screw with M4-thread (e.g. 4822 502 10054, M4x35mm). This screw can be fixed in fixing pin (8) because this part has M4-thread.
- Remove both handle covers (outer part, 5) by removing 4 screws (6).
- Remove both handle arms (inner part, 4) by removing 2 hexagonal screws (2).
- The text strip (3) can be slid out of the grip (1).

## 26.2.SOLDERING TECHNIQUES

Working method:

- Carefully unsolder one after the other the soldering tags of the semi-conductor.
- Remove all superfluous soldering material. Use a sucking iron or sucking litze wire.
- Check that the tags of the replacement part are clean and pre-tinned on the soldering places.
- Locate the replacement semi-conductor exactly on its place, and solder each tag to the relevant printed conductor on the circuit board.

NOTE: Bear in mind that the maximum permissible soldering time is 10 seconds during which the temperature of the tags must not exceed 250°C. The use of solder with a low melting point is therefore recommended.

Take care not to damage the plastic encapsulation of the semi-conductor (softening point of the plastic is 150°C).

ATTENTION: When you are soldering inside the instrument it is essential to use a low-voltage soldering iron, the tip of which must be earthed to the mass of the oscilloscope.

Suitable soldering irons are:

- ORYX micro-miniature soldering instrument, type 6A, voltage 6V, in combination with PLATO pin-point tip type 0-569.
- ERSa miniature soldering iron, type minor 040 B, voltage 6V.
- Low Voltage Mini Soldering Iron, type 800/12 W-6V, power 12W, voltage 6V, order no. 4822 395 10004, in combination with lmm pin-point tip, order no. 4822 395 10012.

Ordinary 60/40 solder with core and 35- to 40W pencil type soldering iron can be used to accomplish the majority of the soldering. If a higher wattage-rating soldering iron is used on the etched circuit boards, excessive heat can cause the etched circuit wiring to separate from the board base material.

### 26.2.1. Soldering and desoldering of surface mounted devices.

Introduction .

This description gives you a method for replacing surface mounted devices (S.M.D.'s) and incorporates subjects such as:

- required tools and materials.
- how to arrange the S.M.D.-workshop. (see fig.26.7.)
- general hints for S.M.D.-handling.
- interchanging S.M.D.'s with two or three connections.
- interchanging S.M.D.'s with four or more connections.

Fig.26.7. Arrangement of working area for S.M.D. exchange.

#### Required tools and materials

The following tools are necessary:

- A hot-air soldering/desoldering station for components with two or three leads: Weller AG 700 pick-a-chip.
- A vacuum, temperature controlled, soldering/desoldering station for components with four or more connections: Weller DS 701 EC.
- Desoldering accessories that can be attached to the Weller DS 701 EC-equipment: for dual-in-line S.M.D.'s VSO 14 and VSO 16 (with 14 and 16 connections such as used on the HF-attenuator p.c.b.) the types with Weller ordering code 587 13 701 and 587 13 702. For dual-in-line S.M.D.'s VSO 40 (with 40 connections such as used on the LCD-unit) the type with Weller ordering code 587 13 703. For QFP 24 S.M.D.'s (such as used on the time base chip unit) the type with Weller ordering code 587 13 704.
- A working area that has been secured against electro static discharge (E.S.D.).
- A pair of tweezers.

NOTE: The Weller equipment can be ordered via your local Weller-dealer.

The following material is necessary:

- "Fluittin" solder diameter of 0,8mm, 15/35, Sn Pb 60.
- Solder paste 026.
- Components. Since not all the components are marked, they must be kept in their original packing in order to avoid interchanging them.
- Desoldering braided wire.

#### General hints for S.M.D.-mounting.

- Protection against E.S.D.: since the working area must be suitable for repair of MOS-devices, some precautions must be taken (see fig.26.7),  
All repairs must be done earthed which means that the repair surface, the soldering iron and the technician must be connected to the earth potential. This is achieved by using a C-MOS antistatic mat that must be connected to earth. The service-technician is connected to earth by wearing an antistatic wristband.
- Components: desoldered components cannot be used again since desoldering is done at a temperature of 350 degrees Celcius while they can only withstand 240 degrees Celcius for max. 10 sec.  
Keep the new components as long as possible in their original packing in order to avoid damage and mixing up new and old S.M.D.'s.
- For an optimal supply of heat a working area must be used that does not lead away the heat: the antistatic mat in fig.26.7. meets this requirement.

#### Interchanging S.M.D.'s with two or three connections.

IMPORTANT: before removing the component, observe very carefully its position in order to avoid that the new component is installed upside-down. This is especially important for capacitors where the metalisation at both ends is longer at the p.c.b. side than at the top side.

Use the equipment Weller AG 700 pick-a-chip and proceed as follows:

- Heat the component up equably with hot air of 350 degrees Celcius.
- Remove the component with a pair of tweezers.
- Clean the p.c.b. tracks, on which the new component has to be soldered, with braided wire or with the use of the vacuum desoldering equipment DS 701 EC.
- Put solder paste on the connections of the new component and position it on the p.c.b.
- Solder the component on to the p.c.b. with the solder described in the materials list. Soldering temperature must be 240 degrees Celsius, soldering time must not exceed 3 sec. per connection.  
The tip of your soldering iron must not touch the component, but must touch the p.c.b. track close to the component.

#### Interchanging S.M.D.'s with four or more connections.

Use the equipment Weller DS 701 EC and attach a suitable desoldering piece ( VSO 14, VSO 16, VSO 40 or OFP 24). Then proceed as follows:

- Adjust the desoldering temperature to 350 degrees Celcius and place the desoldering piece on the IC that has to be removed. Take care that all connections of the IC are equally heated up).
- Switch the vacuum on and lift the component from the p.c.b.
- Clean the p.c.b. tracks, on which the new component has to be soldered, with braided wire or with the use of the vacuum desoldering equipment DS 701 EC.
- Put solder paste on the connections of the new component and position it on the p.c.b.
- Position the component by soldering first the outside connections in a crosswise manner. Soldering temperature must be 240 degrees Celcius. Keep the soldering time as short as possible.
- Solder now the other connections.

- If necessary you must remove superfluous rests of solder with the use of braided wire.

## 26.3. SPECIAL TOOLS

Special tools are available for removal of the slotted nuts behind some potentiometer knobs (service ordering code 5322 395 54024) and the nuts that secure the input BNC-connectors (service ordering code 5322 395 540243). Information how to use these tools is given in chapter 26.1.7.1. and 26.1.7.11. For those who want to make such a tool, sketches are given with dimensions in mm in the figures 26.3. and 26.5. The material is silversteel N094, tempered 40-45 RC.

## Trimming Kit SBC 317 4822 310 50095

The SBC 317 Trimming Kit matches every current trimming requirement on all products. The set contains 27 pieces (22 different bits, plus 3 bit holders and 2 extension pieces). The insulated holders and extension pieces make it easy to reach into a chassis and make accurate adjustments, without wasting time or risking shocks.

The SBC 317 Trimming Kit is packed in a flat transparent case. Several of the most commonly required bits are duplicated. In addition, a spare set of 8 bits is separately available as replacement (4822 310 50016)

For an easy exchange of dual-in-line IC's there is a lay cutter available under service code 5322 395 71004. After having removed the IC, the pins can be soldered one by one out of the p.c.b.

Fig. 26.8 Trimming tool kit

## 26.4. RECALIBRATION AFTER REPAIR

After any electrical component has been renewed the calibration of that particular circuit should be checked, as well as the calibration of other closely-related circuits. Since the power supply affects all circuits, calibration of the entire instrument should be checked if work has been done in the power supply or if the transformer has been renewed.

## 26.5. INSTRUMENT REPACKING

If the instrument is to be shipped to a Service Centre for service or repair, attach a tag showing the full address and the name of the individual at the users firm that can be contacted. The Service Centre needs the complete instrument, its serial number and a fault description. If the original packing is not available, repack the instrument in such a way that no damage occurs during transport.

## 26.6. TROUBLE SHOOTING

### 26.6.1. Introduction

The following information is provided to facilitate trouble shooting. Information contained in other sections of the manual should also be used to locate the defect. An understanding of the circuit is helpful in locating troubles, particularly where integrated circuits are used. Refer to the circuit description for this information.

### 26.6.2. Trouble shooting techniques

If a fault appears, the following test sequence can be used to find the defective part:

- Check if the settings of the controls of the oscilloscope are correct. Consult the Operating Instructions.
- Check the equipment to which the oscilloscope is connected and the interconnection cables.
- Check if the oscilloscope is well-calibrated. If not refer to section 25. "Checking and Adjusting".
- Visually check the part of the oscilloscope in which the fault is suspected. In this way, it is possible to find faults such as bad soldering connections, bad interconnection plugs and wires, damaged components or transistors and IC's that are not correctly plugged into their sockets.
- Location of the circuit part in which the fault is suspected: the symptom often indicates this part of the circuit. If the power supply is defective the symptom will appear in several circuit parts.

After having carried out the previous steps, individual components in the suspected circuit parts must be examined:

- Transistors and diodes. Check the voltage between base and emitter (0,7V approx. in conductive state) and the voltage between collector and emitter (0,2V approx. in saturation) with a voltmeter or an oscilloscope. When removed from the p.c.b. it is possible to test the transistor with an ohmmeter since the base/collector junctions can be regarded as diodes. Like a normal diode, the resistance is very high in one direction and low in the other direction. When measuring take care that the current from the ohmmeter does not damage the component under test.  
Replace the suspected component by a new one if you are sure that the circuit is not in such condition that the new component will be damaged.
- Integrated circuits. In circuit testing can be done with an oscilloscope or voltmeter. A good knowledge of the circuit part under test is essential. Therefore first read the circuit descriptions in Section 3...22.

- Capacitors. Leakage can be traced with an ohmmeter adjusted to its highest resistance range. When testing take care of polarity and maximum allowed voltage. An open capacitor can be checked if the response for AC signals is observed. Also a capacitance meter can be used: compare the measured value with the value and tolerance indicated in the parts list.
- Resistors. Can be checked with an ohmmeter after having unsoldered one side of the resistor from the p.c.b. Compare the measured value with the value and tolerance indicated in the parts list.
- Coils and transformers. An ohmmeter can be used for tracing an open circuit. Shorted or partially shorted windings can be found by checking the wave-form responses when HF signals are passed through the circuit. Also an inductance meter can be used.
- Data latches. To measure on inputs and outputs of data latches a measuring oscilloscope can be triggered by the clock signal which is connected to the clock input of the data latch. Check the input data lines one by one during the active edge of the clock signal.  
This measurement can only be done in this way when there is an acceptable repetition time of the clock signal. A too low clock pulse repetition time results in a low intensity of the trace on the measuring oscilloscope screen.  
The outputs can easily be checked by a voltmeter or oscilloscope.

#### 26.6.3. Trouble shooting the power supplies.

Information for an easy access to the power supplies and for safe working conditions can be found in chapter 26.1.7.9. This chapter also explains how to measure the power supplies in working condition.

##### Primary converter units.

Since these units are almost completely sealed, they must be replaced by a new unit if they are defective. Only a limited number of components in the primary and secondary circuit of a unit can be interchanged. What components are interchangeable and what not can be found in the circuit diagram. If a unit is suspected to be defective, its output voltage can be substituted by a bench-type power supply. This power supply must be capable of delivering at least 2,3 Amp. at 24 Volt DC: the Philips type PE1540 is a suitable type.

##### Secondary converter unit.

It must be borne in mind that this unit does not work if the input supply voltage is lower than 43 Volt DC. So if one of the primary converter units does not function, also the secondary converter unit is dead. In order to be able to determine whether a certain fault condition is initiated by the secondary power supply itself or by the connected oscilloscope circuits, a dummy load is listed in the table below. The table gives also an example of the resistor types that can be used to compose the dummy load: the resistors can be ordered at Concern Service.

Supply voltage	Output Current	Dissipated Power	Dummy resistance and their service ordering code.
+13,8 Volt	1,7 Amp.	23 Watt	8,2 Ohm: 15 Ohm (4822 112 31058) and 18 Ohm (4822 112 31061) in parallel.
-13,8 Volt	1,7 Amp.	23 Watt	8,2 Ohm: 15 Ohm (4822 112 31058) and 18 Ohm (4822 112 31061) in parallel.
+5 Volt digital	2 Amp.	10 Watt	2,5 Ohm: 4,7 Ohm (4322 112 21045) and 5,6 Ohm (4822 112 21047) in parallel.
+5 Volt analog	1,3 Amp.	6,5 Watt	3,7 Ohm: 6,8 Ohm (4822 112 21049) and 8,2 Ohm (4822 112 21052) in parallel.
+25 Volt	0,16 Amp.	4 Watt	150 Ohm (4822 112 21085)
+120 Volt	0,03 Amp.	3,6 Watt	3,9k.Ohm (4822 112 21123)
-120 Volt	0,03 Amp.	3,6 Watt	3,9k.Ohm (4822 112 21123)
-7 Volt	0,33 Amp.	2,3 Watt	22 Ohm (4822 112 21063)

#### 26.6.4. Description of service routines.

##### Introduction

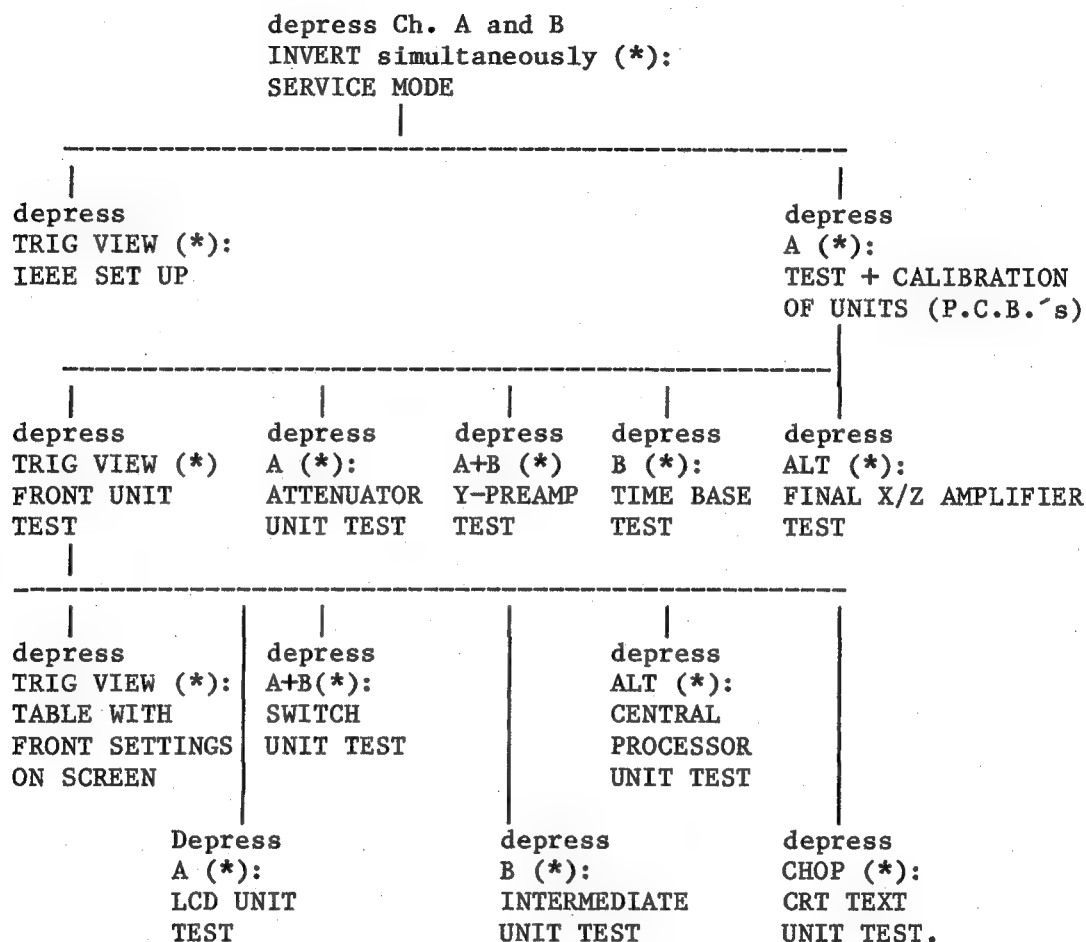

If you depress the channel A and B INVERT pushbuttons simultaneously, the instrument jumps to the service routine. The service routine consists of a big number of separate routines that are logically arranged in a tree-structure. If you are at a certain level in this tree, you can select different branches: the branches that can be selected at a certain level are indicated in a menu that is visible on the CRT-screen if the text display is on.

The branches are selectable with the vertical display mode switches TRIG VIEW, A, A+B, B, ALT and CHOP.

If you want to jump back in the tree you must depress pushbutton AUTO SET. During the service routine the controls of the instrument are mostly out of order (except the vertical display mode switches). The LED'S in the pushbuttons and the LCD's represent the momentary setting of the instrument: this setting is fixed and depends on the part of the service routine you are working in. The new following scheme gives you the tree-structure with selectable programs and their names and the vertical display mode switches that select the programs. This scheme is followed by a description of every program.

## Structure of service routines:

## NORMAL MODE

(\*) means: depress AUTO SET to move upwards in the tree-structure.

## Explanation of the service routines.

## IEEE SET UP.

Function of pushbuttons is arranged as follows:

depress TRIG VIEW: listen only

depress A : talk and listen

depress A + B : software release in LCD-A

The device address can be selected between 00 and 30 with the Ch. A attenuator switch. The IEEE set-up data is also displayed in the Ch. A LCD.

## ATTENUATOR TEST.

This routine helps to check and adjust the attenuator balances for channel A (A depressed) and channel B (B depressed). In this routine the vertical input attenuator of the selected channel is automatically switched between 5 and 500mV/div. (indicated in belonging LCD): now the balance adjustment can be checked/adjusted for minimal trace jump. Changing from channel A to B must be done via operation of the AUTO SET pushbutton.

#### Y-PREAMPLIFIER TEST.

This routine helps to check and adjust the normal/invert balances for channel A (A depressed) and B (B depressed). In this routine the selected channel is automatically switched between normal and inverted display (indicated by LED in belonging pushbutton): now the balance adjustment can be checked/adjusted for minimal trace jump. Changing from channel A to B must be done via operation of the AUTO SET pushbutton. In this mode, the input sensitivity of the channel can be adjusted to the desired value.

#### TIME BASE TEST.

This routine helps to check and adjust the delay and delta T times on the time base. The MAIN TB LCD always shows 10 microsec./div. The following modes can be selected:

- depress TRIG VIEW: the DTB start (= intensified part) at the 3rd division can be adjusted. The DELAY LCD shows 020.00 microsec.
- depress A: the DTB start at the 9th division can be adjusted. The DELAY LCD shows 080.00 microsec.
- depress A+B: the DTB start after DELAY + DELTA T at the 3rd division can be adjusted. The DELAY + DELTA T LCD shows 000.00 microsec.
- depress B: the DTB start after DELAY + DELTA T at the 9th division can be adjusted. The DELAY + DELTA T LCD shows 060.00 microsec.

NOTE: Changing the modes can be done directly; operation of the AUTO SET pushbutton is not necessary.

#### FINAL X/Z-AMPLIFIER TEST.

This routine helps to check and adjust the position of the cursor line. The following modes can be selected:

- depress TRIG VIEW: two vertical cursor lines on the right side of the screen must be positioned upon each other. The LED in the "time" cursor pushbutton is on.
- depress A: the reference cursor must be positioned in the mid of the graticule. The delta cursor must be positioned upon the last right-hand graticule line. The LED in the "time" cursor pushbutton is on.
- depress A+B: check that the reference cursor is upon the first left-hand graticule line and that the delta cursor is upon the last right-hand graticule line. The LED in the "time" cursor pushbutton is on.
- depress B: two horizontal cursor lines are visible on the screen. The reference cursor line must be positioned upon the graticule line in the mid of the screen. The delta cursor line must be positioned upon the last graticule line in the bottom of the screen. The LED in the "voltage" cursor pushbutton is on.
- depress ALT: check that the reference cursor line is upon the last graticule line in the bottom of the screen and that the delta cursor line is upon the first graticule line in the top of the screen. The LED in the "voltage" cursor pushbutton is on.
- depress CHOP: adjust the instrument so that the green area fits inside the outside graticule lines of the screen.

## TABLE WITH FRONT SETTINGS ON SCREEN (SETTING MONITOR).

With this service-routine you are able to check if the signals from the pushbutton switches, rotary switches and potentiometers (CAL/UNCAL) are taken in correctly by the central processor unit. The table consists of 24 rows of 8 bits of information. The bits represent the actual position of the controls: for instance if Ch. A is switched on, the belonging bit is 1.

All the controls except AUTO SET can be activated in this routine: if a control is operated the contents of the table changes. The eight-bit binary value is also represented as a hexadecimal number under the column "hex". The 24 rows represent the following information (if a bit is not used this is indicated with N):

row 00: N/N/N/N/trig view/Ch. B/A+B/Ch. A.  
 row 01: N/N/N/BW LIMIT off/N/N/N/ALT.  
 row 02: N/N/N/Ch. A 50 Ohm/N/Ch. A DC/Ch. A 0/Ch. A AC.  
 row 03: Ch.A UNCAL/Ch.A INVERT/2 bits for Ch.A probe type: 00 = 1:1 probe. 01 = 10:1 probe, 10 = 100:1 probe/4 bits for Ch.A sensitivities: bit pattern carrying from 0000 (5V/div.) till 1011 (1mV/div.)  
 row 04: N/N/N/Ch.B 50 Ohm/N/Ch.B DC/CH.B 0/Ch.B AC.  
 row 05: Ch.B UNCAL/Ch.B INVERT/2 bits for CH.B probe type: bit pattern identical to Ch.A (see row 03)/4 bits for Ch.B sensitivities: identical to Ch.A (see row 03).  
 row 06: row 07, row 08, row 09: all bits not used.  
 row 0A: N/N/N/TB MAGN on/N/3 bits for horizontal display source: 000 = MAIN TB/001 = MTB intensified/010 = MTB intensified and DTB/011 = DTB/100 = MTB intensified and delta T/101 = MTB intensified, DTB and delta T/110 = DTB and delta T/111 = EXT X DEFL.  
 row 0B: N/SINGLE/AUTO/TRIG/N/N/N/MTB NEG SLOPE.  
 row 0C: 4 bits for MTB trigger coupling: 0000 = DC coupling/0001 = LF reject/ 0010 = AC/ 0011 = HF reject/ 0100 = HF reject and DC/4 bits for MTB trigger source: 0000 = Ch.A/ 0001 = Ch.B/ 0010 = COMP/ 0011 = EXT/ 0100 = EXT ÷10/0101 = LINE.  
 row 0D: MTB UNCAL /N/N/5 bits for MTB sweep speeds: bit pattern varying from 00000 (1 sec/div.) till 11000 (10n.sec./div)  
 row 0E: N/N/N/N/N/N/N/DTB NEG SLOPE on.  
 row 0F: 4 bits for DTB trigger coupling: bit pattern identical to MTB (see row 0C)/4 bits for DTB trigger source: bit pattern identical to MTB (see row 0C) except for 0101 (STARTS).  
 row 10: DTB UNCAL /N/N/5 bits for DTB sweep speeds: bit pattern varying from 00000 (500 m.sec/div) till 10111 (10 n.sec/div).  
 row 11,12: 16 bits for the delay time; row 11 incorporates the least significant bits, row 12 the most significant bits.  
 row 13,14: 16 bits for the delta T time; row 13 incorporates the least significant bits, row 14 the most significant bits.  
 row 15: delta T hor./reference hor./delta T vert./reference vert./N/TRACK/RATIO/CURSORS.  
 row 16,17: 16 bits for the time reference cursor position; row 16 incorporates the least significant bits, row 17 the most significant bits.  
 row 18,19: 16 bits for the time delta cursor position; row 18 incorporates the least significant bits, row 19 the most significant bits.

for their position refer to the p.c.b. lay-out of the central processor unit. Normally the row and column wires are at a logic high (+5V) level. However, if a switch (e.g. CHOP) is depressed the column wire (column 1) and the row wire (row 2) of the switch are low (0 Volt).

Now the databus information (e.g. from pushbutton CHOP) can be measured with a standard 2 channel oscilloscope.

- Connect channel A to the signal RDCOL- and adjust the input sensitivity to a suitable value.

- Trigger the measuring oscilloscope on channel A and on the negative slope of the RDCOL- signal.

- Connect channel B to the databus line D1 (see table).

- Now the signal on channel B must be low (0 Volt) during the time that RDCOL- is low if pushbutton CHOP is depressed.

For a well-defined read-out the main time base of the measuring oscilloscope must be set to 0.1 microsec/div.

- Connect channel A to the signal RDRW-

- Connect the channel B to the databus line D2 (see table).

- Now the signal on channel B must be low (0 Volt) during the time that RDRW- is low if pushbutton CHOP is depressed.

COLUMNS (trigger measuring oscilloscope on RDCOL-)

	0	1	2	3	4	5	6	7
ROW 0	SLOPE MTB	B ON	-	TIME CURS.	TIME CURS.	TIME CURS.	TIME CURS.	TIME CURS.
ROW 1	AUTO	ALT	INVERT CH.A	VOLT CURS.	VOLT CURS.	VOLT CURS.	VOLT CURS.	VOLT CURS.
ROW 2	SINGLE	CHOP	INVERT CH.B	50 AC	50 AC	50 AC	50 AC	50 AC
ROW 3	TRIG	-	TRIG	RATIO	DC	TB	-	EXT
ROW 4	0 CH.B	EXT.X DEFL	AUTO SET	REF	0 CH.A	-	TEST	UNIT TEST

NOTE: In the event of a fault, the following steps should be taken:

1. Check the power supply.
2. Check the connections.
3. Check the settings.
4. Check the output.

Another important feature of this test routine is the possibility to

check if the RDCOL- signal is active after the test routine is active.

part of the test routine is active after the test routine is active.

located at the top of the test routine is active after the test routine is active.

The logic levels from column 0 ... 7 are applied to the databus lines

DO ... 7 if the signal RDCOL- is low. The logic levels from row

signal RDRW- is low. The lines RDCOL-, RDRW- and DO ... 7 have

soldering tags to which a measuring probe can be connected:

## CENTRAL PROCESSOR UNIT (CPU) TEST.

In this service routine five different functions can be selected. These functions can be used either for checking and adjusting the instrument or they can be used for checking the correct functioning of the central processor unit. The following can be selected: depress TRIG VIEW: the LCD of channel A shows you the release of the software of the instrument. This is represented in a two digit number.

NOTE: In correspondence concerning this instrument it is recommended to mention the software-release number if you expect a fault in the central processor unit.

depress A: now you can check if the probe indicator IC D1628 functions correctly. This measurement must be done in the same way as the pushbutton test of the switch unit test. If the signal RDRRO is high, the databus lines D0 ... 7 represent a bit pattern that depends on the type of probe connected to the vertical inputs A and B. Only probes with an identification ring function correctly: the ring incorporates a resistor and its resistance value tells D1628 what probe is connected.

The lines RDPRO and D0 ... 7 have tags to which a measuring probe can be connected: for their position refer to the p.c.b. lay out of the central processor unit. Channel A of a standard oscilloscope can be connected to the RDPRO signal. The oscilloscope must be triggered on channel A and on the positive slope of the signal. With channel B the databus line D0 ... 7 can be checked: for this refer to the table below. In the table it is assumed that channel A and B have the same probe type connected to their input.

probe type connected to Ch.A and B	indicator resistor in probe	bit pattern on databus lines							
		Channel A				Channel B			
		D0	D1	D2	D3	D4	D5	D6	D7
no probe	-	1	1	1	1	1	1	1	1
1:1 probe	10 k.Ohm	1	1	1	1	1	1	1	1
10:1 probe	2,32k.Ohm	0	0	0	1	0	0	0	1
10:1 probe	4,12k.Ohm	1	0	0	1	1	0	0	1
50 Ohm									
100:1 probe	6,98k.Ohm	1	0	1	1	1	0	1	1
100:1 probe	6,34k.Ohm	0	0	1	1	0	0	1	1
50 Ohm									

Depress A+B: in this mode the DC voltage present at the tag "DAC" (for location see p.c.b. lay-out of central processor unit) must be 10 Volt. Depress B: in this mode the 8 most significant bits for the digital to analog converter (DAC) are always 0000 0000: the 8 least significant bits are stepwise increased between 0000 0000 and 1111 1111. The result is a sawtooth signal on the tag "DAC" with a value between 0 and 39 m.Volt.

If you want to leave this mode, you have to depress AUTO SET.

Depress ALT: in this mode the 16 bits of the DAC are stepwise increased between 0000 0000 0000 0000 and 1111 1111 1111 1111. The result is a sawtooth signal on the tag "DAC" with a value between 0 and 10 Volt.

If you want to leave this mode you have to depress AUTO SET.

## CRT TEXT UNIT (CTU) TEST

).

In this service routine six different patterns can be selected on the screen. These patterns can be used either for checking and adjusting or they can be used to check the correct functioning of the CRT text unit and its control signal exchange with the central processor unit.

The following test patterns can be selected:

depress TRIG VIEW: the whole screen is white now.

depress A: a fine-grained grid is displayed.

depress A+B: on the CRT screen, alternatly two points are on, two points are off, two points are on, and so on. This is done both in horizontal and vertical deflection.

depress B: on the CRT screen, alternately one point is on, one point is off, one point is on, and so on.

This is done both in horizontal and vertical direction.

depress ALT: a grid consisting of equidstantial horizontal and vertical lines is displayed.

depress CHOP: the complete character set is displayed.

NOTE: Changing from one pattern to another can be done directly, so operation of the AUTO SET pushbutton is not necessary.

# SAFETY INSPECTION AND TESTS AFTER REPAIR AND MAINTENANCE IN THE PRIMARY CIRCUIT.

27.

## 27.6. VOLTAGE TEST

The instrument shall withstand, without electrical breakdown, the application of a test voltage between the supply circuit and accessible conductive parts that are likely to become energized. The test potential shall be 1500 V rms at supply circuit frequency, applied for one second.

The test shall be conducted when the instrument is fully assembled, and with the primary switch in the ON position. During the test, both slides of the primary circuit of the instrument are connected together and to one terminal of the voltage test equipment; the other voltage test equipment terminal is to be connected to the accessible conductive parts.

## 27.2. SAFETY COMPONENTS

Components in the primary circuit may only be renewed by components selected by Philips, see also clause 26.1.2.

## 27.3. CHECKING THE PROTECTIVE EARTH CONNECTION

The correct connection and condition is checked by visual control and by measuring the resistance between the protective lead connection at the plug and the cabinet/frame. The resistance shall not be more than 0.1 Ohm. During measurement the mains cable should be removed from the mains. Resistance variations indicate a defect.

## 27.4. CHECKING THE INSULATION RESISTANCE

Measure the insulation resistance at  $U = 500V$  dc between the mains connections and the protective lead connections. For this purpose set the mains switch to ON. The insulation resistance shall not be less than 2 M.Ohm.

NOTE: 2 M.Ohm is a minimum requirement at 40°C and 92% Relative Humidity. Under normal conditions the insulation resistance should be much higher (10 ... 20 megaohm).

## 27.5. CHECKING THE LEAKAGE CURRENT

The leakage current shall be measured between each pole of the mains supply in turn, and all accessible conductive parts connected together (including the measuring earth terminal). The leakage current is not excessive if the measured currents from the mentioned parts does not exceed 3.5 mA rms.

## 28.3 CABLES AND CONNECTORS

### 28.3.1 Flatcables and connectors

For the flatcables used in this oscilloscope, the required version must be made by yourself with the following parts:

- Universal flatcable, 40 wires, length 60 cm      5322 323 50112

To get the required number of wires the flat cable must be split by means of a pair of scissors or a knife.

The cable must be cut on the required length.

- Flatcable connectors

The connectors can be mounted on the flatcable by means of a pair of pliers or in a bench-vice.

Attention: check the position of the flatcable in the connector before pressing the connector together.

The following connectors are available:

10 pole cable connector X8202-X4001	5322 265 51117
20 pole cable connector X1102-X5901-X8001-X8002	5322 265 54059
24 pole cable connector X8003	5322 265 51114
26 pole cable connector X7006	5322 267 60164
34 pole cable connector X6302,X7301	5322 267 70163
40 pole cable connector X1602	5322 267 70162

### 28.3.2 AMP cable connectors

- Single row cable connectors (without bus-contact)

X5902, X7316, X7321, X6304	
3 pole female type	5322 268 40222

X6301, X6601, X6603, X6303	
5 pole female type	5322 267 40626

- Double row cable connectors (without bus-contact)

X5602, X8401	
6 pole female type	5322 268 40223

- Bus contact for female type      5322 268 20145

- Lock for AMP connectors      5322 268 90091

28.3.3 50 ohm Cables

The 50 Ohm coax-cables are standerdized, so some cables are a little bit too long.

The tules around the cable ends might have the wrong colour, but if necessary it can be replaced by the original one.

Connectors	Ordering number	Remarks
X5613-X9502 } X5617-X9503 } X5622-X4011 }	5322 321 21291	Cable length: 20 cm

## 29.1 ACCESSORIES SUPPLIED WITH THE INSTRUMENT

### 29.1.1 Passive probe PM 8929/09 with automatic range indication

#### 29.1.1.1 Introduction

This 10x attenuator modular is provided with a special BNC plug for automatic range indication, designed for HF oscilloscopes.

The probe consists of 3 separate units:

- the compensation box having a BNC male connector output, with automatic range indication possibility.
- the cable assembly (cable length of PM8929/09 is 1,5 m).
- the probe body including probe tip and RC assy.

At delivery, the probe is adjusted to an oscilloscope with an input capacitance of 9pF.

The attenuator range is selected by a resistor, mounted in the holder of the BNC-connector.

#### 29.1.1.2 Characteristics

- Properties expressed in numerical values with tolerances stated, are guaranteed by the manufacturer.
- Numerical values without tolerances are typical and represent the characteristics of an average probe.
- These characteristics are valid with a termination of 1 M.0hm oscilloscope input, unless otherwise stated.

CHARACTERISTICS	SPECIFICATION	ADDITIONAL INFORMATION
ATTENUATION:		
Attenuation at d.c.	10x + or -2%	
INPUT IMPEDANCE:		
Parallel resistance at d.c.	10M.0hm + or - 1,5%	
at a.c.	See fig. 29.1.	
Parallel capacitance up to 100kHz	13,5pF	Termination: 1M.0hm Oscilloscope input. For parallel cap. as function of freq. see fig. 29.1
COMPENSATION RANGE:		
Input Capacitance of Oscilloscope	5pF...20pF	

## BANDWIDTH:

## Probe only Bandwidth

## At Osc. Input Cap:

Accessories

- Accessory kit, contents:
- Earth cable
  - Spring-loaded test clip
  - Set marking rings
  - Probe tip (2x)
  - Insulating cap
  - DIL cap
  - Wrap pin adapter
  - Earth bus

Fig. 29.1.a Input impedance versus frequency

Fig. 29.1.b AC-component (pk) of max. input voltage versus frequency

### DESCRIPTION OF ACCESSORIES

Earth cable: To minimize ringing on a signal, an earth cable is provided. This cable must first be plugged into the probe body and then be connected to the nearest earth point of the circuit to be measured.

Spring-loaded test clip: This is a provision for hands-free connection to a test point or component lead.

Marking rings: At delivery a set of 3 different coloured marking rings (red, white and blue) are provided. This can be used to help identify the specific probes when using more than one probe.

Probe tip: A spare set of 2 probe tips are standard supplied with the probe. When a probe tip is damaged it can be pulled out by means of a pair of pliers. Then a new tip must be firmly pushed in.

Insulating cap: An insulating cap is provided to cover the metal part of the probe during measurements in densely wired circuits.

D.I.L.cap: This is a cap facilitating measurements on dual-in-line integrated circuits.

Wrap pin adapter: the wrap pin adapter is a provision to make hands-free connection to a wired wrap pin circuit.

Earth bus: This is a provision to minimize ringing in VHF signals, when earthing must be as short as possible.

#### 29.1.1.3 Adjustments

Checking the range indicator.

Check when the BNC plug of the probe with range indication is connected on the oscilloscope input (PM3295), that the LCD indication (AMPL/DIV) is increased by a factor of 10.

#### Matching the probe to your oscilloscope

The measuring probe has been adjusted and checked by the manufacturer. However, to match the probe to your oscilloscope, the following further adjustment is necessary.

- Connect the measuring pin to the CAL socket of the oscilloscope.
- A trimmer C2, can be adjusted through a hole in the compensation box to obtain optimum square-wave response (see Fig. 29.2).

### Adjusting the h.f. step response

**WARNING:** If adjustments of the h.f controls is inevitable, it must be carried out only by a qualified person who is aware of the hazards involved.

The h.f. step response correction network has been adjusted by the manufacturer to match the oscilloscope input. For optimum pulse response, for separate delivered probes, the probe can be adjusted to match your particular oscilloscope.

Later readjustment is only necessary:

- if the probe is to be used with a different type of oscilloscope
- after replacement of a separate unit or an electrical component.

For adjustment, proceed as follows:

- Dismantle the compensation box, see Section 29.1.1.4.
- Connect the probe to a fast pulse generator (rise-time out exceeding 1ns) which is terminated by its characteristic impedance.
- Adjust the generator for a 6 div/100 kHz pulse.
- Set all potentiometers fully clockwise and both trimmers C2 and C4 for minimum capacity.
- Adjust the adjusting elements according to fig. 29.4.

Fig. 29.3 Adjusting elements

Fig. 29.4 Adjusting elements v.s. h.f step response

#### 29.1.1.4 Dismantling (see fig. 29.4)

**WARNING:** The probe shall be disconnected from all voltage sources before any unit separation, replacement or maintenance will be carried out.

#### Dismantling the probe body

The probe body can be removed by sliding the probe body from the cable assembly.

#### Dismantling the compensation box

- Unscrew the knurled nut in a counter-clockwise direction.
- Remove the compensation box by sliding it from the cable assy.
- Slid the cap sideways off the compensation box.
- The h.f adjustment controls are then accessible.

### Replacing the probe tip

The damaged tip can be pulled out by means of a pair of pliers. A new tip must be firmly pushed in.

#### 29.1.1.5 Parts list

For ease of handling some spare parts are delivered in larger quantities as a set.

(see fig. 29.6)

Item	Q.ty	Ordering number	Description
1	1	5322 264 20056	Probe body
2	1	5322 321 21113	Cable assy-1,5m
3	1	5322 219 80646	Compensation box
4	1	5322 321 20223	Earth cable
5	1	5322 264 24019	Spring-loaded test clip
6	6	5322 310 30624	Set of probe tips
7	6	5322 310 30623	Set of insulating caps
8	6	5322 310 30626	Set of DIL caps
9	4	5322 310 30627	Set of WRAP-pin adapters
10	6	5322 267 10043	Set of earth busses

#### 29.2. OPTIONAL ACCESSORIES

##### 29.2.1. IEEE 488/IEC 625 bus interface PM8950

The IEEE 488/IEC 625 is a general-purpose bus interface designed according to the IEEE 488/IEC 625 standard. This option can be either retrofitted or factory installed. It enables the oscilloscope to be used in a measuring system together with other IEEE 488/IEC 625 bus compatible instruments.

For more detailed operating information concerning this facility, refer to the separate booklet:

IEEE 488/IEC 625 BUS INTERFACE PM8950

For installation instructions, see information delivered with the option.
